

NOTES ON GENERAL RELATIVITY (GR) AND GRAVITY

ERNEST YEUNG

ABSTRACT. These are notes on General Relativity (GR) and Gravity.

As of March 23, 2015, I find that the Central Lectures given by Dr. Frederic P. Schuller for the WE Heraeus International Winter School to be, unequivocally, the best, most lucid, and well-constructed lecture series on General Relativity and Gravity. Instead of reinventing the wheel, I write these notes to build upon and supplement the video lectures and tutorials already created by them. This includes my corrections, comments, relations to other aspects of theoretical physics, and code implementing calculations in GR.

It should be noted that for symbolic computation, I heavily use the SageManifolds v.0.7 package for Sage Math. My goal in this area is this: we see a concept or idea from GR and we go from the equation on the blackboard or textbook and into (Python/Sage Math) code that immediately computes a calculation.

I keep these notes available online, openly accessible, and free for anyone, anytime (with your (financial) help and contribution at Tilt/Open, which is a subscription service). I want to keep these notes openly accessible because I want to encourage anyone to freely edit, copy, and make their own notes in the spirit of open-source software.

I continuously update these notes and post them here ernestyalumni.wordpress.com

The stated goal of the WE Heraeus International Winter School on Gravity and Light is to take the student from an introduction to the research frontier (cf. <http://www.gravity-and-light.org/lectures>). I want to get myself and other students or ambitious non-academic (maybe he or she is a working professional who had studied physics before in college, went to work in another field, maybe even, gasp, investment banking or mobile app developer, but still is curious and passionate about physics and want to contribute) equipped with all the tools available to do research, do calculations, to design experiments or collect data. Again, we’re not here to reinvent the wheel. I’m not trying to make a General Relativity appreciation class, but this is a serious attempt towards training to do research.

Part 1. WE Heraeus International Winter School on Gravity and Light

INTRODUCTION (FROM EY)

The International Winter School on Gravity and Light held *central lectures* given by Dr. Frederic P. Schuller. These lectures on General Relativity and Gravity are unequivocally and undeniably, the best and most lucid and well-constructed lecture series on General Relativity and Gravity. The mathematical foundation from topology and differential geometry from which General Relativity arises from is solid, well-selected in rigor. The lectures themselves are well-thought out and clearly explained.

Even more so, the International Winter School provided accompanying Tutorial Sessions for each of the lectures. I had given up hopes in seeing this component of the learning process ever be put online so that anyone and everyone in the world could learn through the Tutorial process as well. I was afraid that nobody would understand how the Tutorial or “Office Hours” session was important for students to digest and comprehend and work out-doing exercises-the material presented in the lectures. This International Winter School gets it and shows how online education has to be done, to do it in an excellent manner, moving forward.

For anyone who is serious about learning General Relativity and Gravity, I would simply point to these video lectures and tutorials.

What I want to do is to build upon the material presented in this International Winter School. Why it’s important to me, and to the students and practicing researchers out there, is that the material presented takes the student from an introduction to the research frontier. That is the stated goal of the International Winter School. I want to dig into and help contribute to the cutting edge in research and this entire program with lectures and tutorials appears to be the most direct and sensible route directly to being able to do research in General Relativity and Gravity. -EY 20150323

1. LECTURE 1: TOPOLOGY

1.1. Lecture 1: Topological Spaces.

Definition 1. *Let M be a set.*

*A **topology** \mathcal{O} is a subset $\mathcal{O} \subseteq \mathcal{P}(M)$, $\mathcal{P}(M)$ power set of M : set of all subsets of M . satisfying*

- (i) $\emptyset \in \mathcal{O}$, $M \in \mathcal{O}$
- (ii) $U \in \mathcal{O}$, $V \in \mathcal{O} \implies U \cap V \in \mathcal{O}$
- (iii) $U_\alpha \in \mathcal{O}$, $\alpha \in \mathcal{A} \implies (\bigcup_{\alpha \in \mathcal{A}} U_\alpha) \in \mathcal{O}$

\mathcal{O} } utterly useless

Definition 2. $\mathcal{O}_{standard} \subseteq \mathcal{P}(\mathbb{R}^d)$

EY : 20150524

I’ll fill in the proof that $\mathcal{O}_{\text{standard}}$ is a topology.

Proof. $\emptyset \in \mathcal{O}_{\text{standard}}$
since $\forall p \in \emptyset, \exists r \in \mathbb{R}^+$: $\mathcal{B}_r(p) \subseteq \emptyset$ (i.e. satisfied “vacuously”)

Suppose $U, V \in \mathcal{O}_{\text{standard}}$.

Let $p \in U \cap V$. Then $\exists r_1, r_2 \in \mathbb{R}^+$ s.t. $\mathcal{B}_{r_1}(p) \subseteq U$
 $\mathcal{B}_{r_2}(p) \subseteq V$

Let $r = \min \{r_1, r_2\}$.
Clearly $\mathcal{B}_r(p) \subseteq U$ and $\mathcal{B}_r(p) \subseteq V$. Then $\mathcal{B}_r(p) \subseteq U \cap V$. So $U \cap V \in \mathcal{O}_{\text{standard}}$.

Suppose, $U_\alpha \in \mathcal{O}_{\text{standard}}, \forall \alpha \in \mathcal{A}$.
Let $p \in \bigcup_{\alpha \in \mathcal{A}} U_\alpha$. Then $p \in U_\alpha$ for at least 1 $\alpha \in \mathcal{A}$.
 $\exists r_\alpha \in \mathbb{R}^+$ s.t. $\mathcal{B}_{r_\alpha}(p) \subseteq U_\alpha \subseteq \bigcup_{\alpha \in \mathcal{A}} U_\alpha$. So $\bigcup_{\alpha \in \mathcal{A}} U_\alpha \in \mathcal{O}_{\text{standard}}$ □

1.2. **2. Continuous maps.**

1.3. **3. Composition of continuous maps.**

1.4. **4. Inheriting a topology.** EY : 20150524

I’ll fill in the proof that given f continuous (cont.), then the restriction of f onto a subspace S is cont. If you want a reference, check out Klaus Jänich [2, pp. 13, Ch. 1 Fundamental Concepts, Sec. Continuous Maps]
If cont. $f : M \rightarrow N$, $S \subseteq M$, then $f|_S$ cont.

Proof. Let open $V \subseteq N$, i.e. $V \in \mathcal{O}_N$ i.e. V in the topology \mathcal{O}_N of N .

$$f|_S^{-1}(V) = \{m \in M \mid f|_S(m) \in V\}$$

Now $f^{-1}(V) = \{m \in M \mid f(m) \in V\}$.
So $f^{-1}(V) \cap S = f|_S^{-1}(V)$
Now f cont. So $f^{-1}(V) \in \mathcal{O}_M$.
and recall $\mathcal{O}_S := \{U \cap S \mid U \in \mathcal{O}_M\}$.

so $f^{-1}(V) \cap S = f|_S^{-1}(V) \in \mathcal{O}_S$ i.e. $f|_S^{-1}(V)$ open.
 $\implies f|_S$ cont.

TOPOLOGY TUTORIAL SHEET

filename : `main.pdf`
The WE-Heraeus International Winter School on Gravity and Light: Topology

EY : 20150524
What I won't do here is retype up the solutions presented in the Tutorial (cf. https://youtu.be/_XkhZQ-hNLs): the presenter did a very good job. If someone wants to type up the solutions and copy and paste it onto this LaTeX file, in the spirit of open-source collaboration, I would encourage this effort.
Instead, what I want to encourage is the use of as much CAS (Computer Algebra System) and symbolic and numerical computation because, first, we're in the 21st century, second, to set the stage for further applications in research. I use Python and Sage Math alot, mostly because they are open-source software (OSS) and fun to use. Also note that the structure of Sage Math modules matches closely to Category Theory.

In checking whether a set is a topology, I found it strange that there wasn't already a function in Sage Math to check each of the axioms. So I wrote my own; see my code snippet, which you can copy, paste, edit freely in the spirit of OSS here, titled `topology.sage`:
[gist github ernestyalumni topology.sage](#)
[Download topology.sage](#)
Loading `topology.sage`, after changing into (with the usual Linux terminal commands, `cd`, `ls`) by

```
sage: load('‘topology.sage’')
```

Exercise 2: Topologies on a simple set.

Question Does $\mathcal{O}_1 := \dots$ constitute a topology ...?.

Solution: Yes, since we check by typing in the following commands in Sage Math:

```
emptyset in O_1
Axiom2check(O_1) # True
Axiom3check(O_1) # True
```

Question What about \mathcal{O}_2 ...?.

Solution: No since the 3rd. axiom fails, as can be checked by typing in the following commands in Sage Math:

```
emptyset in O_2
Axiom2check(O_2) # True
Axiom3check(O_2) # False
```

2. LECTURE 2: TOPOLOGICAL MANIFOLDS

Lecture 2: Manifolds. Topological spaces: \exists so man that mathematicians cannot even classify them.
For spacetime physics, we may focus on topological spaces (M, \mathcal{O}) that can be charted, analogously to how the surface of the earth is charted in an atlas.

2.1. Topological manifolds.

□

Definition 3. A topological space (M, \mathcal{O}) is called a ***d-dimensional topological method*** if $\forall p \in M : \exists U \in \mathcal{O}, U \ni p : \exists x : U \subseteq M \rightarrow x(U) \subseteq \mathbb{R}^d$ $(M, \mathcal{O}), (\mathbb{R}^d, \mathcal{O}_{std})$

(i) x ***invertible*** :

$$x^{-1} : x(U) \rightarrow U$$

(ii) x ***continuous***

(iii) x^{-1} ***continuous***

2.2. Terminology.

2.3. **3. Chart transition maps.** Imagine 2 charts (U, x) and (V, y) with overlapping regions.

2.4. **4. Manifold philosophy.** Often it is desirable (or indeed the way) to define properties (“continuity”) of real-world object $(\mathbb{R} \xrightarrow{\gamma} M)$ by judging suitable coordinates not on the “real-world” object itself, but on a chart-representation of that real world object.

EY’s add-ons. This lecture gives me a good excuse to review Topology and Topological Manifolds from a mathematician’s point of view. I find John M. Lee’s **Introduction to Topological Manifolds** book good because it’s elementary and thorough and it’s fairly recent (2010) so it’s up to date [?]. See my notes and solutions for the book; it’s a file titled `LeeJM_IntroTopManifolds_sol.pdf` of which I’ll try to keep the pdf and LaTeX file available for download on my [ernestyalumni](#) Google Drive (so try to search for it on Google).

TUTORIAL TOPOLOGICAL MANIFOLDS

filename: `Sheet_1.2.pdf`

Exercise 4: Before the invention of the wheel.

Another one-dimensional topological manifold. Another one?

Consider set $F^1 := \{(m, n) \in \mathbb{R}^2 | m^4 + n^4 = 1\}$, equipped with subset topology $\mathcal{O}_{std}|_{F^1}$

Question $x : F^1 \rightarrow \mathbb{R}$ is what?.

Solution . EY : 20150525 The tutorial video https://youtu.be/ghfEQ3u_B6g is really good and this solution is how I’d write it, but it’s really the same (I needed the practice).

$$\begin{aligned} x : F^1 &\rightarrow \mathbb{R} \\ (m, n) &\mapsto m \end{aligned}$$

If $m = 0, n^4 = 1$ so $n = \pm 1$ so it’s not injective.
Let the closed n -dim. upper half-space $\mathbb{H}^n \subseteq \mathbb{R}^1$. Then

$$\begin{aligned} \mathbb{H}^n &= \{(x_1 \dots x_n) \in \mathbb{R}^n | x_n \geq 0\} \\ \text{int}\mathbb{H}^n &= \{(x_1 \dots x_n) \in \mathbb{R}^n | x_n > 0\} \\ -\mathbb{H}^n &= \{(x_1 \dots x_n) \in \mathbb{R}^n | x_n \leq 0\} \\ -\text{int}\mathbb{H}^n &= \{(x_1 \dots x_n) \in \mathbb{R}^n | x_n < 0\} \end{aligned}$$

Question This map x may be made injective by restricting its domain to either of 2 maximal open subsets of F^1 . Which ones?.

Solution .

Let

$$U_+ = F^1 \cap \text{int}\mathbb{H}^2$$
$$U_- = F^1 \cap -\text{int}\mathbb{H}^2$$

Look at

$$x^4 = 1 - n^4$$
$$\implies x = \pm(1 - n^4)^{1/4}$$

Then for

$$x_+^{-1} : (-1, 1) \subseteq \mathbb{R} \rightarrow U_+$$
$$m \mapsto (m, (1 - m^4)^{1/4})$$
$$x_-^{-1} : (-1, 1) \subseteq \mathbb{R} \rightarrow U_-$$
$$m \mapsto (m, -(1 - m^4)^{1/4})$$

x_+, x_- injective (since left inverse exists).

Question Construct injective y .

Solution .

Let

$$V_+ = F^1 \cap \text{int}\mathbb{H}^1$$
$$V_- = F^1 \cap -\text{int}\mathbb{H}^1$$

Then

$$y_+ : V_+ \rightarrow (-1, 1) \subseteq \mathbb{R}$$
$$(m, n) \mapsto n$$
$$y_- : V_- \rightarrow (-1, 1) \subseteq \mathbb{R}$$
$$(m, n) \mapsto n$$

Question Construct inverse y^{-1} . Solution .

For

$$y_+^{-1} : (-1, 1) \subseteq \mathbb{R} \rightarrow V_+$$
$$n \mapsto ((1 - n^4)^{1/4}, n)$$
$$y_-^{-1} : (-1, 1) \subseteq \mathbb{R} \rightarrow V_-$$
$$n \mapsto (-(1 - n^4)^{1/4}, n)$$

y_+, y_- injective (since left inverse exists).

Note $(-1, 0) \notin U_+, U_-$
 $(1, 0) \notin U_+, U_-$
and

$$(0, 1) \notin V_+, V_-$$
$$(0, -1) \notin V_+, V_-$$

Question construct *transition map* $x \circ y^{-1}$.

Solution .

$$x_+ y_+^{-1} : (0, 1) \subseteq \mathbb{R} \rightarrow (0, 1) \subseteq \mathbb{R}$$
$$n \mapsto (1 - n^4)^{1/4}$$
$$x_- y_+^{-1} : (-1, 0) \subseteq \mathbb{R} \rightarrow (0, 1) \subseteq \mathbb{R}$$
$$n \xrightarrow{y_+^{-1}} ((1 - n^4)^{1/4}, n) \xrightarrow{x_-} (1 - n^4)^{1/4}$$
$$x_+ y_-^{-1} : (0, 1) \subseteq \mathbb{R} \rightarrow (-1, 0) \subseteq \mathbb{R}$$
$$n \mapsto -(1 - n^4)^{1/4}$$
$$x_- y_-^{-1} : (-1, 0) \subseteq \mathbb{R} \rightarrow (-1, 0) \subseteq \mathbb{R}$$
$$n \mapsto -(1 - n^4)^{1/4}$$

Question ... Does the collection of these domains and maps form an atlas of F^1 ?.

Yes, with atlas

$$\mathcal{A} = \left\{ \begin{array}{cc} (U_+, x_+) & (V_+, y_+) \\ (U_-, x_-) & (V_-, y_-) \end{array} \right\}$$

Clearly

$$U_+ \cup U_- \cup V_+ \cup V_- = (F^1 \cap \text{int}\mathbb{H}^2) \cup (F^1 \cap -\text{int}\mathbb{H}^2) \cup (F^1 \cap \text{int}\mathbb{H}^1) \cup (F^1 \cap -\text{int}\mathbb{H}^1) =$$
$$= F^1 \cap \mathbb{R}^2 \setminus \{(0, 0)\} = F^1$$

and (the point is that) x_{\pm}, y_{\pm} are homeomorphisms of open sets of F^1 onto open sets of 1 dim. \mathbb{R}^1 (namely $(-1, 1) \subseteq \mathbb{R}^1$), and so \mathcal{A} is an atlas of F^1 .

so far: top. mfd. (M, \mathcal{O})

$$\dim M = d$$

we wish to define a notion of differentiable

curves $\mathbb{R} \rightarrow M$

function $M \rightarrow \mathbb{R}$

maps $M \rightarrow N$

4.1. **1. Strategy.** choose a chart (U, x)

$\gamma : \mathbb{R} \rightarrow M$ portion of curve in chart domain

$$\begin{array}{ccc} \gamma : \mathbb{R} & \xrightarrow{\quad} & U \\ & \searrow x \circ \gamma & \downarrow x \\ & & x(U) \subseteq \mathbb{R}^d \end{array}$$

idea. try to “lift” the undergraduate notion of differentiability of a curve on \mathbb{R}^d to a notion of differentiability of a curve on M

Problem Can this be well-defined under change of chart?

$$\begin{array}{ccccc} & & y(U \cap V) \subseteq \mathbb{R}^d & & \\ & \nearrow y \circ \gamma & \uparrow y & \nwarrow & \\ \gamma : \mathbb{R} & \xrightarrow{\quad} & U \cap V \neq \emptyset & \xrightarrow{y \circ x^{-1}} & \\ & \searrow x \circ \gamma & \downarrow x & \nearrow & \\ & & x(U \cap V) \subseteq \mathbb{R}^d & & \end{array}$$

$x \circ \gamma$ undergraduate differentiable (“as a map $\mathbb{R} \rightarrow \mathbb{R}^d$ ”)

$$\underbrace{y \circ \gamma}_{\text{maybe only continuous, but not undergraduate differentiable}} = \underbrace{(y \circ x^{-1})}_{\text{continuous}} \circ \underbrace{(x \circ \gamma)}_{\text{undergrad differentiable}} = y \circ (x^{-1} \circ x) \circ \gamma$$

At first sight, strategy does not work out.

4.2. **2. Compatible charts.** In section 1, we used any imaginable charts on the top. mfd. (M, \mathcal{O}) .

To emphasize this, we may say that we took U and V from the *maximal atlas* \mathcal{A} of (M, \mathcal{O}) .

Definition 4. Two charts (U, x) and (V, y) of a top. mfd. are called \clubsuit -compatible if either

- (a) $U \cap V = \emptyset$ or
- (b) $U \cap V \neq \emptyset$

chart transition maps have undergraduate \clubsuit property.

EY : 20151109 e.g. since $\mathbb{R}^d \rightarrow \mathbb{R}^d$, can use undergraduate \clubsuit property such as continuity or differentiability.

$$y \circ x^{-1} : x(U \cap V) \subseteq \mathbb{R}^d \rightarrow y(U \cap V) \subseteq \mathbb{R}^d$$

$$x \circ y^{-1} : y(U \cap V) \subseteq \mathbb{R}^d \rightarrow x(U \cap V) \subseteq \mathbb{R}^d$$

Philosophy:

Definition 5. An atlas \mathcal{A}_\clubsuit is a \clubsuit -compatible atlas if any two charts in \mathcal{A}_\clubsuit are \clubsuit -compatible.

Definition 6. A \clubsuit -manifold is a triple $(\underbrace{M, \mathcal{O}}_{\text{top. mfd.}}, \mathcal{A}_\clubsuit)$ $\mathcal{A}_\clubsuit \subseteq \mathcal{A}_{\text{maximal}}$

¹<http://mathoverflow.net/questions/8789/can-every-manifold-be-given-an-analytic-structure>

GR

\clubsuit	undergraduate \clubsuit	
C^0	$C^0(\mathbb{R}^d \rightarrow \mathbb{R}^d) =$	continuous maps w.r.t. \mathcal{O}
C^1	$C^1(\mathbb{R}^d \rightarrow \mathbb{R}^d) =$	differentiable (once) and is continuous
C^k		k -times continuously differentiable
D^k		k -times differentiable
\vdots		
C^∞	$C^\infty(\mathbb{R}^d \rightarrow \mathbb{R}^d)$	
\cup		
C^ω	\exists multi-dim. Taylor exp.	
\mathbb{C}^∞	satisfy Cauchy-Riemann equations, pair-wise	

EY : 20151109 Schuller says: C^k is easy to work with because you can judge k -times cont. differentiability from existence of all partial derivatives **and** their continuity. There are examples of maps that partial derivatives exist but are not D^k , k -times differentiable.

Theorem 1 (Whitney). Any $C^{k \geq 1}$ -atlas, $\mathcal{A}_{C^{k \geq 1}}$ of a topological manifold contains a C^∞ -atlas.

Thus we may w.l.o.g. always consider C^∞ -manifolds, “smooth manifolds”, unless we wish to define Taylor expandibility/complex differentiability ...

EY : 20151109 Hassler Whitney ¹

Definition 7. A smooth manifold $(\underbrace{M, \mathcal{O}}_{\text{top. mfd.}}, \underbrace{\mathcal{A}}_{C^\infty\text{-atlas}})$

$$\begin{array}{ccc} \mathbb{R} & \xrightarrow{\gamma} & M \\ & \searrow x \circ \gamma & \downarrow x \\ & & \mathbb{R}^d \end{array}$$

EY: 20151109 Schuller was explaining that the trajectory is real in M ; the coordinate maps to obtain

coordinates is $x \circ \gamma$

4.3. **4. Diffeomorphisms.** $M \xrightarrow{\phi} N$

If M, N are naked sets, the structure preserving maps are the bijections (invertible maps).

e.g. $\{1, 2, 3\} \rightarrow \{a, b\}$

Definition 8. $M \cong_{\text{set}} N$ (set-theoretically) isomorphic if \exists bijection $\phi : M \rightarrow N$

Examples. $\mathbb{N} \cong_{\text{set}} \mathbb{Z}$

$\mathbb{N} \cong_{\text{set}} \mathbb{Q}$ (EY: 20151109 Schuller says from diagonal counting)

~~$\mathbb{N} \cong_{\text{set}} \mathbb{R}$~~

Now $(M, \mathcal{O}_M) \cong_{\text{top}} (N, \mathcal{O}_N)$ (topl.) isomorphic = “homeomorphic” \exists bijection $\phi : M \rightarrow N$

ϕ, ϕ^{-1} are continuous.

$(V, +, \cdot) \cong_{\text{vec}} (W, +_w, \cdot_w)$ (EY: 20151109 vector space isomorphism) if

\exists bijection $\phi : V \rightarrow W$ linearly

finally

Definition 9. Two C^∞ -manifolds

$(M, \mathcal{O}_M, \mathcal{A}_M)$ and $(N, \mathcal{O}_N, \mathcal{A}_N)$ are said to be **diffeomorphic** if \exists bijection $\phi : M \rightarrow N$ s.t.

$$\phi : M \rightarrow N$$

$$\phi^{-1} : N \rightarrow M$$

are both C^∞ -maps

Theorem 2. # = number of C^∞ -manifolds one can make out of a given C^0 -manifolds (if any) - up to diffeomorphisms.

$\dim M$	#	
1	1	Morse-Radon theorems
2	1	Morse-Radon theorems
3	1	Morse-Radon theorems
4	uncountably infinitely many	
5	finite	surgery theory
6	finite	surgery theory
\vdots	finite	surgery theory

EY : 20151109 cf. <http://math.stackexchange.com/questions/833766/closed-4-manifolds-with-uncountably-many-differentiable-structures>
The wild world of 4-manifolds

TUTORIAL 4 DIFFERENTIABLE MANIFOLDS

EY : 20151109 The gravity-and-light.org website, where you can download the tutorial sheets *and* the full length videos for the tutorials and lectures, are no longer there. = (
Hopefully, the YouTube video will remain: https://youtu.be/FXPdKx0q1KA?list=PLFeEvEPtX_ORQ1ys-7VIsKlBWz7RX-FaL

Exercise 1: True or false?. These basic questions are designed to spark discussion and as a self-test.

Tick the correct statements, but not the incorrect ones!

- (a) The function $f : \mathbb{R} \rightarrow \mathbb{R}$, ...
- -
 - ..., defined by $f(x) = |x^3|$, lies in $C^3(\mathbb{R} \rightarrow \mathbb{R})$.

EY : 20151109 **Solution 1a3.** For $f : \mathbb{R} \rightarrow \mathbb{R}$, $f(x) = |x^3| = \begin{cases} x^3 & \text{if } x \geq 0 \\ -x^3 & \text{if } x < 0 \end{cases}$

$$f'(x) = \begin{cases} 3x^2 & \text{if } x \geq 0 \\ -3x^2 & \text{if } x < 0 \end{cases}$$
$$f''(x) = \begin{cases} 6x & \text{if } x \geq 0 \\ -6x & \text{if } x < 0 \end{cases}$$

Thus,

$f(x) = |x^3| \in C^1(\mathbb{R})$ but $f(x) \notin C^2(\mathbb{R}) \subseteq C^3(\mathbb{R})$

-
-

- (b)
- (c)

Short Exercise 4: Undergraduate multi-dimensional analysis .

A good notation and basic results for partial differentiation.

For a map $f : \mathbb{R}^d \rightarrow \mathbb{R}$ we denote by the map $\partial_i f : \mathbb{R}^d \rightarrow \mathbb{R}$ the partial derivative with respect to the i -th entry.

Question .: Given a function

$$f : \mathbb{R}^3 \rightarrow \mathbb{R}; (\alpha, \beta, \delta) \mapsto f(\alpha, \beta, \delta) := \alpha^3 \beta^2 + \beta^2 \delta + \delta$$

calculate the values of the following derivatives:

Solution .:

- $(\partial_2 f)(x, y, z) =$
- $(\partial_1 f)(\square, \circ, *) =$
- $(\partial_1 \partial_2 f)(a, b, c) =$
- $(\partial_3^2 f)(299, 1222, 0) =$

EY: 20151110

For $f(\alpha, \beta, \delta) := \alpha^3 \beta^2 + \beta^2 \delta + \delta$, or $f(x, y, z) = x^3 y^2 + y^2 z + z$,

$$(\partial_2 f) = 2(x^3 y + y z)$$

$$(\partial_1 f) = 3x^2 y^2$$

$$(\partial_1 \partial_2 f) = 6x^2 y$$

$$(\partial_3^2 f) = 0$$

and so

- $(\partial_2 f)(x, y, z) = 2(x^3 y + y z)$
- $(\partial_1 f)(\square, \circ, *) = 3\square^2 \circ^2$
- $(\partial_1 \partial_2 f)(a, b, c) = 6a^2 b$
- $(\partial_3^2 f)(299, 1222, 0) = 0$

Exercise 5: Differentiability on a manifold.

How to deal with functions and curves in a chart

Let $(M, \mathcal{O}, \mathcal{A})$ be a smooth d -dimensional manifold. Consider a chart (U, x) of the atlas \mathcal{A} together with a smooth curve $\gamma : \mathbb{R} \rightarrow U$ and a smooth function $f : U \rightarrow \mathbb{R}$ on the domain U of the chart.

Question .: Draw a commutative diagram containing the chart domain, chart map, function, curve and the respective represen-

tatives of the function and the curve in the chart.

Solution .:

Question .: Consider, for $d = 2$,

$$(x \circ \gamma)(\lambda) := (\cos(\lambda), \sin(\lambda)) \text{ and } (f \circ x^{-1})(x, y) := x^2 + y^2$$

Using the chain rule, calculate

$$(f \circ \gamma)'(\lambda)$$

explicitly.

Solution .:

EY : 20151109 Indeed, the domains and codomains of this $f \circ \gamma$ mapping makes sense, from $\mathbb{R} \rightarrow \mathbb{R}$ for

$$(f \circ \gamma)'(\lambda) = (Df) \cdot \dot{\gamma}(\lambda) = \frac{\partial f}{\partial x^j} \dot{\gamma}^j(\lambda) = 2x(-\sin \lambda) + 2y \cos \lambda = 2(-\cos \lambda \sin \lambda + \sin \lambda \cos \lambda) = 0$$

5. LECTURE 5: TANGENT SPACES

lead question: “what is the velocity of a curve γ point p ?”

5.1. Velocities.

Definition 10. $(M, \mathcal{O}, \mathcal{A})$ smooth mfd.

curve $\gamma : \mathbb{R} \rightarrow M$ at least C^1 .

Suppose $\gamma(\lambda_0) = p$

The **velocity** of γ at p is the linear map

$$v_{\gamma, p} : C^\infty(M) \xrightarrow{\sim} \mathbb{R}$$

$$C^\infty(M) := \{f : M \rightarrow \mathbb{R} \mid f \text{ smooth function}\} \text{ equipped with } (f \oplus g)(p) := f(p) + g(p) \\ (\lambda \otimes g)(p) := \lambda \cdot g(p)$$

\sim denotes linear map on top of \rightarrow .

$$f \mapsto v_{\gamma, p}(f) := (f \circ \gamma)'(\lambda_0)$$

intuition

Schuller says: children run around the world. Temperature function as temperature contour lines. You feel the temperature.

You observe the rate of change of temperature as you run around. f is temperature.

past: “ $\underbrace{v^i}_{\text{vector}}(\partial_i f) = (\underbrace{v^i \partial_i}_{\text{vector}})f$ ”

5.2. Tangent vector space.

Definition 11. For each point $p \in M$

def the **set** “tangent space $\neq_0 M$ at p ”

$$T_p M := \{v_{\gamma, p} \mid \gamma \text{ smooth curves}\}$$

picture:

rather M than (embedded) $p \in T_p M$ EY : 20151109 see https://youtu.be/pepU_7NJSGM?t=12m38s for the picture

Observation: $T_p M$ can be made into a vector space.

$$\oplus : T_p M \times T_p M \rightarrow T_p M \\ (v_{\gamma, p} \oplus v_{\delta, p})(\underbrace{f}_{\in C^\infty(M)}) := v_{\gamma, p}(f) +_{\mathbb{R}} v_{\delta, p}(f) \\ \odot : \mathbb{R} \times T_p M \rightarrow T_p M \\ (\alpha \odot v_{\gamma, p})(f) := \alpha \cdot_{\mathbb{R}} v_{\gamma, p}(f)$$

Remains to be shown that

- (i) $\exists \sigma$ curve : $v_{\gamma, p} \oplus v_{\delta, p} = v_{\sigma, p}$
- (ii) $\exists \tau$ curve : $\alpha \odot v_{\gamma, p} = v_{\tau, p}$

Claim: $\tau : \mathbb{R} \rightarrow M$

where $\mu_\alpha : \mathbb{R} \rightarrow \mathbb{R}$, does the trick.

$$\tau(\lambda) := \gamma(\alpha \lambda + \lambda_0) = (\gamma \circ \mu_\alpha)(\lambda) \quad r \mapsto \alpha \cdot r + \lambda_0$$

$$\tau(0) = \gamma(\lambda_0) = p$$

$$v_{\tau, p} := (f \circ \tau)'(0) = (f \circ \gamma \circ \mu_\alpha)'(0) \\ = (f \circ \gamma)'(\lambda_0) \cdot \alpha = \\ = \alpha \cdot v_{\gamma, p}$$

Now for the sum:

$$v_{\gamma, p} \oplus v_{\delta, p} \stackrel{?}{=} v_{\sigma, p}$$

make a choice of chart $(\underbrace{U}_{\ni p}, x)$ In cloud: ill definition alarm bells.

and define:

Claim:

$$\sigma : \mathbb{R} \rightarrow M$$

$$\sigma(\lambda) := x^{-1}(\underbrace{(x \circ \gamma)(\lambda_0 + \lambda) + (x \circ \delta)(\lambda_1 + \lambda) - (x \circ \gamma)(\lambda_0)}_{\mathbb{R} \rightarrow \mathbb{R}^d})$$

does the trick.

Proof. Since:

$$\sigma_x(0) = x^{-1}((x \circ \gamma)(\lambda_0) + (x \circ \delta)(\lambda_1) - (x \circ \gamma)(\lambda_0)) \\ = \delta(\lambda_1) = p$$

Now:

$$v_{\sigma_x, p}(f) := (f \circ \sigma_x)'(0) = \\ = (\underbrace{(f \circ x^{-1})}_{\mathbb{R}^d \rightarrow \mathbb{R}} \circ \underbrace{(x \circ \sigma_x)}_{\mathbb{R} \rightarrow \mathbb{R}^d})'(\gamma) = \underbrace{(x \circ \sigma_x)'(0)}_{(x \circ \gamma)'(\lambda_0) + (x \circ \delta)'(\lambda_1)} \cdot (\partial_i(f \circ x^{-1}))(x(\sigma(0))) = \\ = (x \circ \gamma)'(\lambda_0)(\partial_i(f \circ x^{-1}))(x(p)) + (x \circ \delta)(\lambda_1)(\partial_i(f \circ x^{-1}))(x(p)) \\ = (f \circ \gamma)'(\lambda_0) + (f \circ \delta)'(\lambda_1) = \\ = v_{\gamma, p}(f) + v_{\delta, p}(f) \quad \forall f \in C^\infty(M)$$

$$v_{\gamma,p} \oplus v_{\delta,p} = v_{\sigma,p}$$

picture: (cf. https://youtu.be/pepU_7NJSgM?t=39m5s)

$$\begin{aligned}\gamma &: \mathbb{R} \rightarrow M \\ \delta &: \mathbb{R} \rightarrow M\end{aligned}$$

$(\gamma \oplus)(\lambda) := \gamma(\lambda) + \delta(\lambda)$
EY : 20151109 Schuller says adding trajectories is chart dependent, bad. Adding velocities is good.

5.3. Components of a vector wrt a chart.

Definition 12. Let $(U, x) \in \mathcal{A}_{smooth}$.

Let $\gamma : \mathbb{R} \rightarrow U$
 $\gamma(0) = p$
Calculate

$$\begin{aligned}v_{\gamma,p}(f) &:= (f \circ \gamma)'(0) = \underbrace{((f \circ x^{-1}) \circ (x \circ \gamma))'}_{\mathbb{R}^d \rightarrow \mathbb{R}}(0) \\ &= \underbrace{(x \circ \gamma)^{i'}}_{\dot{\gamma}_x^i(0)} \cdot \underbrace{(\partial_i(f \circ x^{-1}))(x(p))}_{=:(\frac{\partial f}{\partial x^i})_p}\end{aligned}$$

think cloud $f : M \rightarrow \mathbb{R}$

$$= \boxed{\dot{\gamma}_x^i(0) \cdot \left(\frac{\partial}{\partial x^i}\right)_p} f \quad \forall f \in C^\infty(M)$$

\therefore as a map.

$$v_{\gamma,p} \underbrace{=}_{\text{use of chart}} \underbrace{\gamma_x^i(0)}_{\text{“components of the velocity } v_{\gamma,p}\text{”}}$$

$$\underbrace{\left(\frac{\partial}{\partial x^i}\right)}_{\text{basis elements of the } T_p M \text{ wrt which the components need to be understood. “chart induced basis of } T_p M\text{”}}$$

Picture: https://youtu.be/pepU_7NJSgM?t=1h16s

5.4. 4. Chart-induced basis.

Definition 13. $(U, x) \in \mathcal{A}_{smooth}$
the $\left(\frac{\partial}{\partial x^1}\right)_p, \dots, \left(\frac{\partial}{\partial x^d}\right)_p \in T_p U \subseteq T_p M$
constitute a **basis** of $T_p U$

Proof. remains: linearly independent

□

$$\begin{aligned}\lambda^i \left(\frac{\partial}{\partial x^i}\right)_p &\stackrel{!}{=} 0 \\ \implies \lambda^i \left(\frac{\partial}{\partial x^i}\right)_p (x^j) &= \lambda^i \partial_i (\underbrace{x^j \circ x^{-1}}_p)(x(p)) = \underbrace{x^j \circ x^{-1} : \mathbb{R}^d \rightarrow \mathbb{R}}_{(\alpha^1, \dots, \alpha^d) \mapsto \alpha^j} \\ &= \lambda^i \delta_i^j = \lambda^j \quad j = 1, \dots, d\end{aligned}$$

in cloud: $x^j : U \rightarrow \mathbb{R}$ differentiable

□

Corollary 1. $\dim T_p M = d = \dim M$

Terminology: $X \in T_p M \rightarrow \exists \gamma : \mathbb{R} \rightarrow M : X = v_{\gamma,p}$ and
 $\exists \underbrace{X_1^1, \dots, X^d}_{\in \mathbb{R}} : X = X^i \left(\frac{\partial}{\partial x^i}\right)_p$

5.5. 5. Change of vector components under a change of chart. **✖** vector does **not** change under change of chart.

Let (U, x) and (V, y) be overlapping charts and $p \in U \cap V$.
Let $X \in T_p M$

$$X_{(y)}^i \cdot \left(\frac{\partial}{\partial y^i}\right)_p \underbrace{=}_{(V,y)} X \underbrace{=}_{(U,x)} X_x^i \left(\frac{\partial}{\partial x^i}\right)_p$$

to study change of components formula:

$$\begin{aligned}\left(\frac{\partial}{\partial x^i}\right)_p f &= \partial_i(f \circ x^{-1})(x(p)) = \\ &= \partial_i(\underbrace{(f \circ y^{-1})}_{\mathbb{R}^d \rightarrow \mathbb{R}} \circ \underbrace{(y \circ x^{-1})}_{\mathbb{R}^d \rightarrow \mathbb{R}^d})(x(p)) \\ &= (\partial_i(y^i \circ x^{-1}))(x(p)) \cdot (\partial_j(f \circ y^{-1}))(y(p)) = \\ &= \boxed{\left(\frac{\partial y^p}{\partial x^i}\right)_p \cdot \left(\frac{\partial f}{\partial y^j}\right)_p} f \\ \implies X_{(x)}^i \left(\frac{\partial y^j}{\partial x^i}\right)_p \left(\frac{\partial}{\partial y^j}\right)_p &= X_{(y)}^j \left(\frac{\partial}{\partial y^j}\right)_p \\ \implies \boxed{X_{(y)}^j} &= \left(\frac{\partial y^j}{\partial x^i}\right)_p X_{(x)}^i\end{aligned}$$

5.6. 6. Cotangent spaces. $T_p M = V$

trivial $(T_p M)^* := \{\varphi : T_p M \xrightarrow{\sim} \mathbb{R}\}$
Example: $f \in C^\infty(M)$

$$\begin{aligned}(df)_p : T_p M &\xrightarrow{\sim} \mathbb{R} \\ X &\mapsto (df)_p(X)\end{aligned}$$

i.e. $\boxed{(df)_p \in T_p M^*}$

$(df)_p$ called the gradient of f $p \in M$.
Calculate components of gradient w.r.t. chart-induced basis (U, x)

require $\pi \circ \sigma = id_M$

Schuller says: in quantum mechanics, Aside: $\psi : M \rightarrow \mathbb{C}$

6.2. **Tangent bundle of smooth manifold.** $(M, \mathcal{O}, \mathcal{A})$ smooth manifold

(a) as a **set** $TM := \dot{\bigcup}_{p \in M} T_p M$

(b) surjective $\pi : TM \rightarrow M$ the *unique* point $p \in M$, $X \in T_p M$

$$X \mapsto p$$

situation: $\underbrace{TM}_{\text{set}} \quad \underbrace{\xrightarrow{\pi}}_{\text{surjective map}} \quad \underbrace{M}_{\text{smooth manifold}}$

(c) Construct topology on TM that is the coarsest topology such that π (just) continuous. (“initial topology with respect to π ”).

$$\mathcal{O}_{TM} := \{\text{preim}_{\pi}(U) | \mathcal{U} \in \mathcal{O}\}$$

Show: Tutorial \mathcal{O}_{TM} Schuller says this is shown in the tutorial (TM, \mathcal{O}_{TM})

Construction of a C^∞ -atlas on TM from the C^∞ -atlas \mathcal{A} on M .

$$\mathcal{A}_{TM} := \{(T\mathcal{U}, \xi_x) | (U, x) \in \mathcal{A}\}$$

where

$$\xi_x : T\mathcal{U} \rightarrow \mathbb{R}^{2 \cdot \dim M}$$
$$X \mapsto \underbrace{((x^1 \circ \pi)(X), \dots, (x^d \circ \pi)(X), (dx^1)_{\pi(X)}(X), \dots, (dx^d)_{\pi(X)}(X))}_{(U, x) - \text{ coords of } \pi(X) \text{ (d many)}}$$

where $X \in T_{\pi(X)} M$

$$X = X^i_{(x)} \left(\frac{\partial}{\partial x^i} \right)_{\pi(X)}$$

$$(dx^j)_{\pi(X)}(X) = (dx^j)_{\pi(X)} \left(X^i_{(x)} \left(\frac{\partial}{\partial x^i} \right)_{\pi(X)} \right) =$$
$$= X^i_{(x)} \delta^j_i = X^j_{(x)}$$

Write $\xi_x^{-1} : \xi_x(TU) \subseteq \mathbb{R}^{2\dim M} \rightarrow TU$

$$(\alpha^1, \dots, \alpha^d, \beta^1, \dots, \beta^d) := \beta^i \left(\frac{\partial}{\partial x^i} \right) \underbrace{x^{-1}(\alpha^1, \dots, \alpha^d)}_{\pi(X)}$$

$$((df)_p)_j := (df)_p \left(\left(\frac{\partial}{\partial x^j} \right)_p \right)$$
$$= \left(\frac{\partial f}{\partial x^j} \right)_p = \partial_j (f \circ x^{-1})(x(p))$$

Theorem 3. Consider chart $(U, x) \implies x^i : U \rightarrow \mathbb{R}$

Claim: $(dx^1)_p, (dx^2)_p, \dots, (dx^d)_p$ basis of $T_p^* M$

\implies In fact: dual basis:

$$(dx^a)_p \left(\left(\frac{\partial}{\partial x^b} \right)_p \right) = \left(\frac{\partial x^a}{\partial x^b} \right)_p = \dots = \delta^a_b$$

5.7. **7. Change of components of a covector under a change of chart:**

$$\underbrace{T_p^* M}_{\ni \omega} \text{ with } \omega_{(y)}(dy^j)_p = \omega = \omega_{(x)i}(dx^i)_p$$

$$\implies \boxed{\omega_{(y)i} = \frac{\partial x^j}{\partial y^i} \omega_{(x)j}}$$

6. LECTURE 6: FIELDS

So far:

$$\begin{array}{c} T_p M \\ \vdots \downarrow \\ T_p^* M \\ \vdots \downarrow \\ \vdots \end{array},$$

now
in Thought Cloud: theory of bundles

6.1. **Bundles.**

Definition 14. A *bundle* is a triple

$$E \xrightarrow{\pi} M$$

E smooth manifold “**total space**”
 π smooth map (surjective) “**projection map**”
 M smooth manifold “**base space**”

Example E = cylinder M = circle

Definition 15. define **fibre over** p
 $:= \text{preim}_{\pi}(\{p\})$

Definition 16. A *section* σ of a bundle

$$\begin{array}{c} E \\ \phi^* \uparrow \\ \downarrow d \\ M \end{array}$$

Check:

$$\begin{aligned} & (\xi_y \circ \xi_x^{-1})(\alpha^1, \dots, \alpha^d, \beta^1, \dots, \beta^d) = \\ &= \xi_y \left(\beta^i \left(\frac{\partial}{\partial x^i} \right)_{x^{-1}(\alpha^1, \dots, \alpha^d)} \right) \\ &= \left(\dots, (y^i \circ \pi)(\beta^m \cdot \left(\frac{\partial}{\partial x^m} \right)_{x^{-1}(\alpha^1 \dots \alpha^d)}), \dots, \dots (dy^i)_{x^{-1}(\alpha^1, \dots, \alpha^d)} \left(\beta^m \left(\frac{\partial}{\partial x^m} \right)_{x^{-1}(\alpha^1 \dots \alpha^d)} \right), \dots \right) = \\ &= (\dots, (y^i \circ x^{-1})(\alpha^1, \dots, \alpha^d), \dots, \dots, \underbrace{\beta^m (dy^i)_{x^{-1}(\alpha^1, \dots, \alpha^d)} \left(\left(\frac{\partial}{\partial x^m} \right)_{x^{-1}(\alpha^1 \dots \alpha^d)} \right)}_{\beta^m \left(\frac{\partial y}{\partial x^m} \right)_{x^{-1}(\alpha^1 \dots \alpha^d)}}) \end{aligned}$$

upshot

$$\left(\frac{\partial y}{\partial x^m} \right)_{x^{-1}(\alpha^1 \dots \alpha^d)} = \partial_m (y^i \circ x^{-1})(x \circ (x^{-1}(\alpha^1 \dots \alpha^d))) = \partial_m (y^i \circ x^{-1})(\alpha^1 \dots \alpha^d) \text{ smooth.}$$

$$\underbrace{TM}_{\text{smooth manifold}} \underbrace{\xrightarrow{\pi}}_{\text{smooth map}} \underbrace{M}_{\text{smooth manifold}}$$

bundle, called the tangent bundle.

6.3. **Vector fields.**

Definition 17. A *smooth vector field* χ is a smooth map

6.4. **The $C^\infty(M)$ -module $\Gamma(TM)$.** set $\Gamma(TM) = \{ \chi \mid M \rightarrow TM \mid \text{smooth section} \}$

$$(\chi \oplus \tilde{\chi})(f) := (\chi f) + \underbrace{\tilde{\chi}}_{C^\infty(M)}(f)$$
$$(g \odot \xi)(f) := g \cdot \underbrace{\chi}_{C^\infty(M)}(f)$$

upshot: set of all smooth vector fields can be made into a $C^\infty(M)$ -module.
Fact:

- (1) $\text{ZFC} \implies$ every vector space has a basis.
- (2) no such result exists for modules.

This is a shame, because otherwise, we could have chosen (for any manifolds) vector fields,

$$\Xi_{(1)}, \dots, \Xi_{(d)} \in \Gamma(TM)$$

and would be able to write every vector field Ξ

$$\Xi = \underbrace{f^i}_{\text{component functions}} \cdot \Xi_{(i)}$$

Simple counterexample
Schuller says: Take a sphere, Morse Theorem, every smooth vector field must vanish at 2 pts. “mustn’t choose a global basis”

However:

$$\frac{\partial}{\partial x^i} : U \xrightarrow{\text{smooth}} TU$$
$$p \mapsto \left(\frac{\partial}{\partial x^i} \right)_p$$

6.5. **Tensor fields.** so far
 $\Gamma(M)$ = ”set of vector fields” $C^\infty(M)$ -module
 $\Gamma(T^*M)$ = “covector fields” $C^\infty(M)$ -module

Definition 18. An (r, s) -tensor field T is a multi-linear map

$$T : \underbrace{\Gamma(T^*M) \times \dots \times \Gamma(T^*M)}_r \times \Gamma(TM) \times \dots \times \Gamma(TM) \xrightarrow{\sim} C^\infty(M)$$

Example: $f \in C^\infty(M)$

$$\begin{aligned} df : \Gamma(TM) &\xrightarrow{\sim} C^\infty(M) \\ \Xi &\mapsto df(\Xi) := \Xi[f] \end{aligned}$$

df (0,1)-T.F. (tensor field)
where $(\Xi f)(\underbrace{p}_{\in M}) := \underbrace{\Xi(p)}_{\in T_p M} f$
can check: df is C^∞ -linear

7. LECTURE 7: CONNECTIONS

$$\begin{aligned} \nabla_X f &= Xf = (df)(X) \text{ but (not quite)} \\ X : C^\infty(M) &\rightarrow C^\infty(M) \\ df : \Gamma(TM) &\rightarrow C^\infty(M) \\ \nabla_X : C^\infty(M) &\rightarrow C^\infty(M) \end{aligned}$$

$$\begin{array}{ccc} \nabla_X : C^\infty(M) & \longrightarrow & C^\infty(M) \\ \vdots \downarrow & & \vdots \downarrow \end{array}$$
$$\nabla_X : \begin{array}{c} TM^p \otimes T^*M^q \text{ i.e.} \\ \left(\begin{smallmatrix} p \\ q \end{smallmatrix} \right) \text{ tensor field} \end{array} \longrightarrow \begin{array}{c} TM^p \otimes T^*M^q \text{ i.e.} \\ \left(\begin{smallmatrix} p \\ q \end{smallmatrix} \right) \text{ tensor field} \end{array}$$

7.1. **Directional derivatives of tensor fields.** manifold with connection is quadruple $(M, \mathcal{O}, \mathcal{A}, \nabla)$
topology \mathcal{O}
atlas \mathcal{A}
Consider chart $(U, x) \in \mathcal{A}$

Definition 19. \forall pair $(X, (p, q) - \text{tensor field}) \equiv (X, (p, q) - TF)$,
connection ∇ on smooth manifold $(M, \mathcal{O}, \mathcal{A})$
 $\nabla : (X, (p, q) - TF) \rightarrow (p, q) - TF$ s.t.
(i) $\nabla_X f = Xf$
(ii) $\nabla_X (T + S) = \nabla_X T + \nabla_X S$
(iii)

$$\nabla_X (T(\omega, Y)) = (\nabla_X T)(\omega, Y) + T(\nabla_X \omega, Y) + T(\omega, \nabla_X Y)$$

“Leibnitz” rule.
As

$$T \otimes S(\omega_{(1)} \dots \omega_{(p+r)}, Y_{(1)} \dots Y_{(q+s)}) = T(\omega_{(1)} \dots \omega_{(p)}, Y_{(1)} \dots Y_{(q)}) \cdot S(\omega_{(p+1)} \dots \omega_{(p+r)}, Y_{(q+1)} \dots Y_{(q+s)})$$

so

$$\nabla_X(T \otimes S) = (\nabla_X T) \otimes S + T \otimes \nabla_X S$$

$$(iv) \quad \nabla_{fX+Z}T = f\nabla_X T + \nabla_Z T \quad C^\infty\text{-linear}$$

7.2. New structure on $(M, \mathcal{O}, \mathcal{A})$ required to fix ∇ . There are $(\dim M)^3$ many Γ_{jk}^i

$$\begin{aligned} \Gamma_{jk}^i : U &\rightarrow \mathbb{R} \\ p &\mapsto \left(dx^i \left(\nabla_{\frac{\partial}{\partial x}} \frac{\partial}{\partial x^j} \right) \right) (p) \end{aligned}$$

Now $\nabla_{\frac{\partial}{\partial x^m}}(dx^i) = ?$

$$\begin{aligned} &\underbrace{\nabla_{\frac{\partial}{\partial x^m}} \left(dx^i \left(\frac{\partial}{\partial x^j} \right) \right)}_{\substack{\delta_j^i \\ \parallel \quad (iii)}} = \frac{\partial}{\partial x^m} (\delta_j^i) = 0 \\ &= \left(\nabla_{\frac{\partial}{\partial x^m}} dx^i \right) \left(\frac{\partial}{\partial x^j} \right) + dx^i \underbrace{\left(\nabla_{\frac{\partial}{\partial x^m}} \frac{\partial}{\partial x^j} \right)}_{\Gamma_{jm}^q \frac{\partial}{\partial x^q}} = 0 \\ &\implies \left(\nabla_{\frac{\partial}{\partial x^m}} dx^i \right) \left(\frac{\partial}{\partial x^j} \right) = -\Gamma_{jm}^i \\ &\nabla_{\frac{\partial}{\partial x^m}} dx^i = -\Gamma_{jm}^i dx^j \end{aligned}$$

Hence

$$\begin{aligned} (\nabla_X Y)^i &= X(Y^i) + \Gamma_j^i \underbrace{}_{\substack{m \\ \text{last entry goes in direction of } X}} Y^j X^m \\ (\nabla_X \omega)_i &= X(\omega_i) + -\Gamma_{im}^j \omega_j X^m \end{aligned}$$

Note that for the immediately above expression for $(\nabla_X Y)^i$, in the second term on the right hand side, Γ_{jm}^i has the last entry at the bottom, m going in the direction of X , so that it matches up with X^m . This is a good mnemonic to memorize the index positions of Γ .

summary so far:

$$\begin{aligned} (\nabla_X Y)^i &= X(Y^i) + \Gamma_{jm}^i Y^j X^m \\ (\nabla_X \omega)_i &= X(\omega_i) + -\Gamma_{im}^j \omega_j X^m \end{aligned}$$

similarly, by further application of Leibnitz

T a $(1,2)$ -TF (tensor field)

$$(\nabla_X T)^i_{jk} = X(T^i_{jk}) + \Gamma_{sm}^i T^s_{jk} X^m - \Gamma_{jm}^s T^i_{sk} X^m - \Gamma_{km}^s T^i_{js} X^m$$

What is a Euclidean space:

$(M = \mathbb{R}^n, \mathcal{O}_{\text{st}}, \mathcal{A})$ smooth manifold.

Assume $(\mathbb{R}^n, \text{id}_{\mathbb{R}^n}) \in \mathcal{A}$ and

$$(\Gamma_{(x)}^i)_{jk} = dx^i \left((\nabla_{\underline{E}})_{\frac{\partial}{\partial x^k}} \frac{\partial}{\partial x^j} \right) \stackrel{!}{=} 0$$

7.3. Change of Γ 's under change of chart. $(U, x), (V, y) \in \mathcal{A}$ and $U \cap V \neq \emptyset$

$$\Gamma_{jk}^i(y) := dy^i \left(\nabla_{\frac{\partial}{\partial y^k}} \frac{\partial}{\partial y^j} \right) = \frac{\partial y^i}{\partial x^q} dx^q \left(\nabla_{\frac{\partial x^p}{\partial y^k} \frac{\partial}{\partial x^p}} \frac{\partial x^s}{\partial y^j} \frac{\partial}{\partial x^s} \right)$$

Note ∇_{fX} is C^∞ -linear for fX

covector dy^i is C^∞ -linear in its argument

$$\begin{aligned} \implies \Gamma_{jk}^i(y) &= \frac{\partial y^i}{\partial x^q} dx^q \left(\frac{\partial x^p}{\partial y^k} \left[\left(\nabla_{\frac{\partial}{\partial x^p}} \frac{\partial x^s}{\partial y^j} \right) \frac{\partial}{\partial x^s} + \frac{\partial x^s}{\partial y^j} \left(\nabla_{\frac{\partial}{\partial x^p}} \frac{\partial}{\partial x^s} \right) \right] \right) = \\ &= \frac{\partial y^i}{\partial x^q} \frac{\partial x^p}{\partial y^k} \frac{\partial}{\partial x^p} \frac{\partial x^s}{\partial y^j} \delta_s^q + \frac{\partial y^i}{\partial x^q} \frac{\partial x^p}{\partial y^k} \frac{\partial x^s}{\partial y^j} \Gamma_{sp}^q(x) \end{aligned}$$

$$(1) \quad \Gamma_{jk}^i(y) = \frac{\partial y^i}{\partial x^q} \frac{\partial^2 x^q}{\partial y^j \partial y^k} + \frac{\partial y^i}{\partial x^q} \frac{\partial x^s}{\partial y^j} \frac{\partial x^p}{\partial y^k} \Gamma_{sp}^q(x)$$

Eq. (1) is the change of connection coefficient function under the change of chart $(U \cap V, x) \rightarrow (U \cap V, y)$

7.4. Normal Coordinates.

Tutorial 7 Connections. Exercise 1. : True or false?

- (a)
 - $\nabla_{fX} Y = f \nabla_X Y$ by definition so $\nabla_{fX} = f \nabla_X$ i.e. ∇_X is $C^\infty(M)$ -linear in X
 - $f \in C^\infty(M)$ is a $(0,0)$ -tensor field. $\nabla_X f = Xf \equiv X(f)$ by definition.
 - If the manifold is flat, I'm assuming that means that the manifold is globally a Euclidean space, and by definition, $\Gamma = 0$.

$$\nabla_X Y = X^j \frac{\partial}{\partial x^j} (Y^i) \frac{\partial}{\partial x^i} + \Gamma_{jk}^i Y^k X^j \frac{\partial}{\partial x^i} = X^j \frac{\partial Y^i}{\partial x^j} \frac{\partial}{\partial x^i} + 0$$

and similarly for any (p,q) -tensor field, i.e.

$$\nabla_X T = X^j \frac{\partial T_{j_1 \dots j_q}^{i_1 \dots i_p}}{\partial x^j}$$

•

$$\nabla_X f = X^j \frac{\partial f}{\partial x^j} = X \cdot \text{grad}(f)$$

- $\forall (U, x) \in \mathcal{A}$, locally (after working out the first few cases, and doing induction, one can look up the expression for the local form; I found it in Nakahara's **Geometry, Topology and Physics**, Eq. 7.26, and it needs to be modified for the convention of order of bottom indices for Γ :

$$\nabla_\nu t_{\mu_1 \dots \mu_q}^{\lambda_1 \dots \lambda_p} = \partial_\nu t_{\mu_1 \dots \mu_q}^{\lambda_1 \dots \lambda_p} + \Gamma_{\kappa \nu}^{\lambda_1} t_{\mu_1 \dots \mu_q}^{\lambda_2 \dots \lambda_p} + \dots + \Gamma_{\kappa \nu}^{\lambda_p} t_{\mu_1 \dots \mu_q}^{\lambda_1 \dots \lambda_{p-1} \kappa} - \Gamma_{\mu_1 \nu}^{\kappa} t_{\kappa \mu_2 \dots \mu_q}^{\lambda_1 \dots \lambda_p} - \dots - \Gamma_{\mu_q \nu}^{\kappa} t_{\mu_1 \dots \mu_{q-1} \kappa}^{\lambda_1 \dots \lambda_p}$$

Clearly, ∇_X is uniquely fixed $\forall p \in M$ by choosing each of the $(\dim M)^3$ many connection coefficient functions Γ .

- (b)
 - $\nabla : \mathfrak{X}(M) \rightarrow \mathfrak{X}(M)$
 - $\nabla : (p,q)\text{-tensor field} \mapsto (p,q)\text{-tensor field}$
 - By definition, ∇ satisfies the Leibniz rule.
 -
 -
 -

Exercise 2. : Practical rules for how ∇ acts Torsion-free covariant derivative boils down to a connection coefficient function Γ that is symmetric in the bottom indices.

•

$$\nabla_X f = X(f) = X^i \frac{\partial f}{\partial x^i}$$

-
-
-
-
-

$$(\nabla_X Y)^a = X^i \frac{\partial Y^a}{\partial x^i} + \Gamma_{jk}^a Y^j X^k$$

$$(\nabla_X \omega)_a = X^i \frac{\partial \omega_a}{\partial x^j} - \Gamma_{ak}^i \omega_i X^k$$

$$(\nabla_m T)^a_{bc} = \frac{\partial}{\partial x^m} (T^a_{bc}) + \Gamma_{im}^a T^i_{bc} - \Gamma_{bm}^i T^a_{ic} - \Gamma_{cm}^j T^a_{bj}$$

$$(\nabla_{[m} A)_{n]} = (\nabla_m A)_n - (\nabla_n A)_m = \frac{\partial A_n}{\partial x^m} - \Gamma_{nm}^i A_i - \left(\frac{\partial A_m}{\partial x^n} - \Gamma_{mn}^i A_i \right) = \frac{\partial A_m}{\partial x^m} - \frac{\partial A_m}{\partial x^n}$$

$$(\nabla_m \omega)_{nr} = \frac{\partial \omega_{nr}}{\partial x^m} - \Gamma_{nm}^i \omega_{ir} - \Gamma_{rm}^i \omega_{ni}$$

Exercise 3. : Connection coefficients

Question .

The connection coefficient functions Γ in chart $(U \cap V, y)$ is given, in terms of chart $(U \cap V, x)$ as follows:
Recall Eq. (1)

$$\Gamma_{jk}^i(y) = \frac{\partial y^i}{\partial x^q} \frac{\partial^2 x^q}{\partial y^j \partial y^k} + \frac{\partial y^i}{\partial x^q} \frac{\partial x^s}{\partial y^j} \frac{\partial x^p}{\partial y^k} \Gamma_{sp}^q(x)$$

8. LECTURE 8: PARALLEL TRANSPORT & CURVATURE (INTERNATIONAL WINTER SCHOOL ON GRAVITY AND LIGHT 2015)

8.1. Parallelity of vector fields.

Definition 20. (1) *parallelly transported along smooth curve* $\gamma : \mathbb{R} \rightarrow M$
if

(2) $\nabla_{v_\gamma} X = 0$

(2) A slightly weaker condition
is “parallel”

$$(\nabla_{v_{\gamma, \gamma(\lambda)}} X)_{\gamma(\lambda)} = \mu(\lambda) X_{\gamma(\lambda)}$$

8.2. Autoparallely transported curves.

Definition 21. curve $\gamma : \mathbb{R} \rightarrow M$ is called
autoparallely transported if

(3) $\nabla_{v_\gamma} v_\gamma \stackrel{!}{=} 0$

8.3. Autoparallel equation.

in summary:

(4) $\ddot{\gamma}_{(x)}^m(\lambda) + (\Gamma_{(x)}^m)_{ab}(\gamma(\lambda)) \dot{\gamma}_{(x)}^a(\lambda) \dot{\gamma}_{(x)}^b(\lambda) = 0$

8.4. Torsion.

Definition 22. *torsion of a connection* ∇ is the $(1, 2)$ -**tensor field**

(5) $T(\omega, X, Y) := \omega(\nabla_X Y - \nabla_Y X - [X, Y])$

(Inside a cloud)
[X, Y] vector field defined by

$$[X, Y]f := X(Yf) - Y(Xf)$$

Proof. check T is C^∞ -linear in each entry

$$T(\omega, fX, Y) = \omega(\nabla_{fX} Y - \nabla_Y(fX) - [fX, Y])$$

□

Definition 23. A $(M, \mathcal{O}, \mathcal{A}, \nabla)$ is called *torsion-free* if $T = 0$

In a chart

$$\begin{aligned} T^i_{ab} &:= T\left(dx^i, \frac{\partial}{\partial x^a}, \frac{\partial}{\partial x^b}\right) = dx^i(\dots) \\ &= \Gamma^i_{ab} - \Gamma^i_{ba} = 2\Gamma^i_{[ab]} \end{aligned}$$

From now on, in these lectures, we only use torsion-free connections.

8.5. 4. Curvature.

Definition 24. *Riemann curvature of a connection* ∇ is the $(1, 3)$ -tensor field

(6) $Riem(\omega, Z, X, Y) := \omega(\nabla_X \nabla_Y Z - \nabla_Y \nabla_X Z - \nabla_{[X, Y]} Z)$

Proof. do it: C^∞ -linear in each slot.

□

Tutorials $Riem^i_{jab} = \dots$

TUTORIAL 8 PARALLEL TRANSPORT & CURVATURE

Exercise 1.

Exercise 2. : Where connection coefficients appear

It was suggested in the tutorial sheets and hinted in the lecture that the following should be committed to memory.

Question : Recall the autoparallel equation for a curve γ .

(a)

$$\nabla_{v_\gamma} v_\gamma = 0$$

(b)

$$\begin{aligned} \nabla_{v_\gamma} v_\gamma &= \nabla_{\dot{\gamma} \frac{\partial}{\partial x^\mu}} v_\gamma = \dot{\gamma}^\nu \nabla_{\partial_\nu} v_\gamma = \dot{\gamma}^\nu \left[\frac{\partial v_\gamma^\mu}{\partial x^\nu} + \Gamma_{\mu\nu}^\rho v_\gamma^\mu \right] \frac{\partial}{\partial x^\rho} = \dot{\gamma}^\nu \left[\frac{\partial \dot{\gamma}^\rho}{\partial x^\nu} + \Gamma_{\mu\nu}^\rho \dot{\gamma}^\mu \right] \frac{\partial}{\partial x^\rho} = 0 \\ &\implies \boxed{\ddot{\gamma}^\rho + \Gamma_{\mu\nu}^\rho \dot{\gamma}^\mu \dot{\gamma}^\nu} \end{aligned}$$

as, for example, for $F(x(t))$,

$$\frac{dF(x(t))}{dt} = \dot{x} \frac{\partial F}{\partial x} = \frac{d}{dt} F$$

so that

$$\dot{\gamma}^\nu \frac{\partial v_\gamma^\mu}{\partial x^\nu} = \frac{d}{d\lambda} v_\gamma^\mu = \frac{d^2}{d\lambda^2} \gamma^\mu$$

Question : Determine the coefficients of the Riemann tensor with respect to a chart (U, x) .

Recall this manifestly covariant definition

$$\text{Riem}(\omega, Z, X, Y) = \omega(\nabla_X \nabla_Y Z - \nabla_Y \nabla_X Z - \nabla_{[X, Y]} Z)$$

We want R^i_{jab}.
now

$$\nabla_X \nabla_Y Z = \nabla_X \left((Y^\mu \frac{\partial}{\partial x^\mu} Z^\rho + \Gamma^\rho_{\mu\nu} Z^\mu Y^\nu) \frac{\partial}{\partial x^\rho} \right) = (X^\alpha \frac{\partial}{\partial x^\alpha} (Y^\mu \frac{\partial}{\partial x^\mu} Z^\rho + \Gamma^\rho_{\mu\nu} Z^\mu Y^\nu) + \Gamma^\rho_{\alpha\beta} (Y^\mu \frac{\partial}{\partial x^\mu} Z^\alpha + \Gamma^\alpha_{\mu\nu} Z^\mu Y^\nu) X^\beta) \frac{\partial}{\partial x^\rho}$$

For $X = \partial_a$, $Y = \partial_b$, $Z = \partial_j$, then the partial derivatives of the coefficients of the input vectors become zero.

$$\implies \nabla_{\partial_a} \nabla_{\partial_b} \partial_j = \frac{\partial}{\partial x^a} (\Gamma^i_{jb}) + \Gamma^i_{\alpha a} \Gamma^\alpha_{jb}$$

Now

$$[X, Y]^i = X^j \frac{\partial}{\partial x^j} Y^i - Y^j \frac{\partial X^i}{\partial x^j}$$

For coordinate vectors, $[\partial_i, \partial_j] = 0 \ \forall i, j = 0, 1 \dots d$.

Thus

$$R^i_{jab} = \frac{\partial}{\partial x^a} \Gamma^i_{jb} - \frac{\partial}{\partial x^b} \Gamma^i_{ja} + \Gamma^i_{\alpha a} \Gamma^\alpha_{jb} - \Gamma^i_{\alpha b} \Gamma^\alpha_{ja}$$

Question : $\text{Ric}(X, Y) := \text{Riem}^m_{amb} X^a Y^b$ define $(0, 2)$ -tensor?.

Yes, transforms as such:

EY developments. I roughly follow the spirit in Theodore Frankel’s **The Geometry of Physics: An Introduction** Second Ed. 2003, Chapter 9 Covariant Differentiation and Curvature, Section 9.3b. The Covariant Differential of a Vector Field. P.S. EY : 20150320 I would like a copy of the Third Edition but I don’t have the funds right now to purchase the third edition: go to my tilt crowdfunding campaign, <http://ernestyalumni.tilt.com>, and help with your financial support if you can or send me a message on my various channels and ernestyalumni gmail email address if you could help me get a hold of a digital or hard copy as a pro bono gift from the publisher or author.

The spirit of the development is the following:

“How can we express connections and curvatures in terms of forms?” -Theodore Frankel.

From Lecture 7, connection ∇ on vector field Y , in the “direction” X ,

$$\nabla_{\frac{\partial}{\partial x^k}} Y = \left(\frac{\partial Y^i}{\partial x^k} + \Gamma^i_{jk} Y^j \right) \frac{\partial}{\partial x^i}$$

Make the ansatz (approche, impostazione) that the connection ∇ acts on Y , the vector field, first:

$$\nabla Y(X) = \left(X^k \frac{\partial Y^i}{\partial x^k} + \Gamma^i_{jk} Y^j X^k \right) \frac{\partial}{\partial x^i} = X^k \left(\nabla_{\frac{\partial}{\partial x^k}} Y \right)^i \frac{\partial}{\partial x^i} = (\nabla_X Y)^i \frac{\partial}{\partial x^i} = \nabla_X Y$$

Now from Lecture 7, Definition for Γ ,

$$dx^i \left(\nabla_{\frac{\partial}{\partial x^k}} \frac{\partial}{\partial x^j} \right) = \Gamma^i_{jk}$$

Make this ansatz (approche, impostazine)

$$\nabla \frac{\partial}{\partial x^j} = (\Gamma^i_{jk} dx^k) \otimes \frac{\partial}{\partial x^i} \in \Omega^1(M, TM) = T^*M \otimes TM$$

where $\Omega^1(M, TM) = T^*M \otimes TM$ is the set of all TM or vector-valued 1-forms on M , with the 1-form being the following:

$$\Gamma^i_{jk} dx^k = \Gamma^i_{j} \in \Omega^1(M) \qquad i = 1 \dots \dim(M) \\ j = 1 \dots \dim(M)$$

So Γ^i_{j} is a $\dim M \times \dim M$ matrix of 1-forms (EY !!!).

Thus

$$\nabla Y = (d(Y^i) + \Gamma^i_j Y^j) \otimes \frac{\partial}{\partial x^i}$$

So the connection is a (smooth) map from TM to the set of all vector-valued 1-forms on M , $\Omega^1(M, TM)$, and then, after “eating” a vector Y , yields the “covariant derivative”:

$$\nabla : TM \rightarrow \Omega^1(M, TM) = T^*M \otimes TM$$

$$\nabla : Y \mapsto \nabla Y$$

$$\nabla Y : TM \rightarrow TM$$

$$\nabla Y(X) \mapsto \nabla Y(X) = \nabla_X(Y)$$

Now

$$\left[\frac{\partial}{\partial x^i}, \frac{\partial}{\partial x^j} \right] f = \frac{\partial}{\partial x^i} \left(\frac{\partial}{\partial x^j} \right) - \frac{\partial}{\partial x^j} \left(\frac{\partial}{\partial x^i} \right) = 0$$

(this is okay as on $p \in (U, x)$; x -coordinates on same chart (U, x))

EY : 20150320 My question is when is this nontrivial or nonvanishing (i.e. not equal to 0).

$$[e_a, e_b] = ?$$

for a frame (e_c) and would this be the difference between a tangent bundle TM vs. a (general) vector bundle?

Wikipedia helps here. cf. wikipedia, “Connection (vector bundle)”

$$\nabla : \Gamma(E) \rightarrow \Gamma(T^*M \otimes E) = \Omega^1(M, E)$$

$$\nabla e_a = \omega^c_{ab} f^b \otimes e_c$$

$$f^b \in T^*M \text{ (this is the dual basis for } TM \text{ and, note, this is for the manifold, } M$$

$$\nabla_{f_b} e_a = \omega^c_{ab} e_c \in E$$

$$\omega^c_a = \omega^c_{ab} f^b \in \Omega^1(M)$$

is the connection 1-form, with $a, c = 1 \dots \dim V$. EY : 20150320 This V is a vector space living on each of the fibers of E . I know that $\Gamma(T^*M \otimes E)$ looks like it should take values in E , but it’s meaning that it takes vector values of V . Correct me if I’m wrong: ernestyalumni at gmail and various social media.

Let $\sigma \in \Gamma(E)$, $\sigma = \sigma^a e_a$

$$\nabla \sigma = (d\sigma^c + \omega^c_{ab} \sigma^a f^b) \otimes e_c \text{ with}$$

$$d\sigma^c = \frac{\partial \sigma^c}{\partial x^b} f^b$$

$$\implies \nabla_X \sigma = \left(X^b \frac{\partial \sigma^c}{\partial x^b} + \omega^c_{ab} \sigma^a X^b \right) e_c = X^b \left(\frac{\partial \sigma^c}{\partial x^b} + \omega^c_{ab} \sigma^a \right) e_c$$

9. LECTURE 9: NEWTONIAN SPACETIME IS CURVED!

Axiom 1 (Newton I:). *A body on which no force acts moves uniformly along a straight line*

Axiom 2 (Newton II:). *Deviation of a body’s motion from such uniform straight motion is effected by a force, reduced by a factor of the body’s reciprocal mass.*

Remark:

- (1) 1st axiom - in order to be relevant - must be read as a measurement prescription for the geometry of space ...
- (2) Since gravity universally acts on every particle, in a universe with at least two particles, gravity must not be considered a force if Newton I is supposed to remain applicable.

9.1. **Laplace’s questions.** Laplace *1749

†1827

Q: “Can gravity be encoded in a curvature of space, such that its effects show if particles under the influence of (no other) force we postulated to move along straight lines in this curved space?”

Answer: No!

Proof. gravity is a force point of view

$$\begin{aligned} m\ddot{x}^\alpha(t) &= F^\alpha(x(t)) \\ m\ddot{x}^\alpha(t) &= \underbrace{mf^\alpha}_{F^\alpha}(x(t)) \end{aligned}$$

$-\partial_\alpha f^\alpha = 4\pi G\rho$ (Poisson)
 ρ mass density of matter
(EY : 20150330) You know this, $F = Gm_1m_2/r^2$

$$\ddot{x}^\alpha(t) - f^\alpha(x(t)) = 0$$

Laplace asks: Is this $(\ddot{x}(t))$ of the form

$$\ddot{x}^\alpha(t) + \Gamma^\alpha_{\beta\gamma}(x(t))\dot{x}^\beta(t)\dot{x}^\gamma(t) = 0$$

Conclusion: One cannot find Γ ’s such that Newton’s equation takes the form of an autoparallel.

□

9.2. **The full wisdom of Newton I.** use also the information from Newton’s first law that particles (no force) move uniformly

introduce the appropriate setting to talk about the difference easily
insight: in spacetime uniform & straight motion is simply straight motion

So let’s try in spacetime:
let $x : \mathbb{R} \rightarrow \mathbb{R}^3$

be a particle’s trajectory in space \longleftrightarrow worldline (history) of the particle

$$\begin{aligned} X : \mathbb{R} &\rightarrow \mathbb{R}^4 \\ t &\mapsto (t, x^1(t), x^2(t), x^3(t)) := \\ &:= (X^0(t), X^1(t), X^2(t), X^3(t)) \end{aligned}$$

That’s all it takes:
Trivial rewritings:

$$\dot{X}^0 = 1$$

$$\begin{aligned} \implies \begin{array}{|l} \ddot{X}^0 \\ \ddot{X}^\alpha - f^\alpha(X(t)) \cdot \dot{X}^0 \cdot \dot{X}^0 \end{array} &= \begin{array}{|l} 0 \\ 0 \end{array} \quad (\alpha = 1, 2, 3) \implies \begin{array}{|l} \ddot{X}^a + \Gamma^a_{bc}\dot{X}^b\dot{X}^c \\ \end{array} = \begin{array}{|l} 0 \\ 0 \end{array} \end{aligned}$$

$a = 0, 1, 2, 3$
antoparallel eqn in spacetime

Yes, choosing $\Gamma^0_{ab} = 0$

$$\Gamma^\alpha_{\beta\gamma} = 0 = Gamma^\alpha_{0\beta} = \Gamma^\alpha_{\beta 0}$$

only: $\Gamma^\alpha_{00} \stackrel{!}{=} -f^\alpha$

Question: Is this a coordinate-choice artifact?

No, since $R^\alpha_{0\beta 0} = -\frac{\partial}{\partial x^\beta} f^\alpha$ (only non-vanishing components) (tidal force tensor, – the Hessian of the force component)

Ricci tensor $\implies R_{00} = R^m_{0m0} = -\partial_\alpha f^\alpha = 4\pi G\rho$

Poisson: $-\partial_\alpha f^\alpha = 4\pi G \cdot \rho$

writing: $T_{00} = \frac{1}{2}s$

$$\implies \boxed{R_{00} = 8\pi GT_{00}}$$

Einstein in 1912 

Conclusion: Laplace’s idea works in spacetime

Remark

$$\begin{aligned} \Gamma^\alpha_{00} &= -f^\alpha \\ R^\alpha_{\beta\gamma\delta} &= 0 \quad \alpha, \beta, \gamma, \delta = 1, 2, 3 \\ \boxed{R_{00} = 4\pi G\rho} \end{aligned}$$

Q: What about transformation behavior of LHS of

$$\underbrace{\ddot{x}^a + \Gamma^a_{bc}\dot{X}^b\dot{X}^c}_{(\nabla_{v_X} v_X)^a} = 0$$

$:= a^a$ “acceleration vector”

9.3. **The foundations of the geometric formulation of Newton’s axiom.** new start

Definition 25. A *Newtonian spacetime* is a quintuple

$$(M, \mathcal{O}, \mathcal{A}, \nabla, t)$$

where $(M, \mathcal{O}, \mathcal{A})$ 4-dim. smooth manifold

$t : M \rightarrow \mathbb{R}$ smooth function

(i) “*There is an absolute space*”

$$(dt)_p \neq 0 \quad \forall p \in M$$

(ii) “*absolute time flows uniformly*”

$$\nabla dt \underbrace{=}_\text{space of (0,2)-tensor fields} 0 \quad \text{everywhere}$$

∇dt is a (0,2)-tensor field

(iii) add to axioms of Newtonian spacetime $\nabla = 0$ torsion free

Definition 26. absolute space at time τ

$$\begin{aligned} S_\tau &:= \{p \in M | t(p) = \tau\} \\ \xrightarrow{dt \neq 0} M &= \coprod S_\tau \end{aligned}$$

Definition 27. A vector $X \in T_pM$ is called

- (a) *future-directed* if
- (b) *spatial* if
- (c) *past-directed* if

$$dt(X) > 0$$

$$dt(X) = 0$$

$$dt(X) < 0$$

picture

Newton I: The worldline of a particle under the influence of no force (gravity isn't one, anyway) is a future-directed autoparallel i.e.

$$\nabla_{v_X} v_X = 0$$

$$dt(v_X) > 0$$

Newton II:

$$\nabla_{v_X} v_X = \frac{F}{m} \iff m \cdot a = F$$

where F is a spatial vector field:

$$dt(F) = 0$$

Convention: restrict attention to atlases $\mathcal{A}_{\text{stratified}}$ whose charts (\mathcal{U}, x) have the property

$$\begin{array}{lcl} x^0 : \mathcal{U} \rightarrow \mathbb{R} \\ x^1 : \mathcal{U} \rightarrow \mathbb{R} \\ \vdots \quad \vdots \\ x^3 \end{array} \quad x^0 = t|_{\mathcal{U}} \quad \implies \quad \begin{array}{l} 0 \text{ "absolute time flows uniformly"} \\ 0 = \nabla_{\frac{\partial}{\partial x^a}} dx^0 = -\Gamma^0_{ba} \end{array} \quad a = 0, 1, 2, 3$$

Let's evaluate in a chart (\mathcal{U}, x) of a stratified atlas $\mathcal{A}_{\text{sheet}}$: Newton II:

$$\nabla_{v_X} v_X = \frac{F}{m}$$

in a chart.

$$\begin{aligned} (X^0)'' + \Gamma^0_{cd}(X^a)'(X^b)' &\stackrel{\text{stratified atlas}}{=} 0 \\ (X^\alpha)'' + \Gamma^\alpha_{\gamma\delta} X^{\gamma'} X^{\delta'} + \Gamma^\alpha_{00} X^{0'} X^{0'} + 2\Gamma^\alpha_{\gamma 0} X^{\gamma'} X^{0'} &= \frac{F^\alpha}{m} \quad \alpha = 1, 2, 3 \\ \implies (X^0)''(\lambda) = 0 \implies X^0(\lambda) = a\lambda + b &\quad \text{constants } a, b \text{ with} \\ X^0(\lambda) = (x^0 \circ X)(\lambda) \stackrel{\text{stratified}}{=} (t \circ X)(\lambda) \end{aligned}$$

convention parametrize worldline by absolute time

$$\begin{aligned} \frac{d}{d\lambda} &= a \frac{d}{dt} \\ a^2 \ddot{X}^\alpha + a^2 \Gamma^\alpha_{\gamma\delta} \dot{X}^\gamma \dot{X}^\delta + a^2 \Gamma^\alpha_{00} \dot{X}^0 \dot{X}^0 + 2\Gamma^\alpha_{\gamma 0} \dot{X}^\gamma \dot{X}^0 &= \frac{F^\alpha}{m} \\ \implies \underbrace{\ddot{X}^\alpha + \Gamma^\alpha_{\gamma\delta} \dot{X}^\gamma \dot{X}^\delta + \Gamma^\alpha_{00} \dot{X}^0 \dot{X}^0 + 2\Gamma^\alpha_{\gamma 0} \dot{X}^\gamma \dot{X}^0}_{a^\alpha} &= \frac{1}{a^2} \frac{F^\alpha}{m} \end{aligned}$$

cf. [Lecture 10: Metric Manifolds \(International Winter School on Gravity and Light 2015\)](#)

We establish a structure on a smooth manifold that allows one to assign vectors in each tangent space a length (and an angle between vectors in the same tangent space).

From this structure, one can then define a notion of length of a curve.

Then we can look at shortest curves.

Requiring then that the shortest curves coincide with the straightest curves (wrt ∇) will result in ∇ being determined by the metric structure.

$$g \stackrel{\text{straight=short}}{\overset{T=0}{\rightsquigarrow}} \nabla \rightsquigarrow \text{Riem}$$

10.1. **Metrics.**

Definition 28. A metric g on a smooth manifold $(M, \mathcal{O}, \mathcal{A})$ is a $(0, 2)$ -tensor field satisfying

- (i) *symmetry* $g(X, Y) = g(Y, X) \quad \forall X, Y \text{ vector fields}$
- (ii) *non-degeneracy*: the musical map

$$\begin{aligned} \text{"flat"} \flat : \Gamma(TM) &\rightarrow \Gamma(T^*M) \\ X &\mapsto \flat(X) \end{aligned}$$

$$\text{where} \quad \flat(X)(Y) := g(X, Y)$$

$$\flat(X) \in \Gamma(T^*M)$$

$$\text{In thought bubble: } \flat(X) = g(X, \cdot)$$

... is a C^∞ -isomorphism in other words, it is invertible.

Remark: $(\flat(X))_a$ or

X_a

$$(\flat(X))_a := g_{am} X^m$$

Thought bubble: $\flat^{-1} = \sharp$

$$\flat^{-1}(\omega)^a := g^{am} \omega_m$$

$$\flat^{-1}(\omega)^a := (g^{\text{"-1''}})^{am} \omega_m \implies \text{not needed. (all of this is not needed)}$$

Definition 29. The $(2, 0)$ -tensor field $g^{\text{"-1''}}$ with respect to a metric g is the symmetric

$$g^{\text{"-1''}} : \Gamma(T^*M) \times \Gamma(T^*M) \rightarrow C^\infty(M)$$

$$(\omega, \sigma) \mapsto \omega(\flat^{-1}(\sigma)) \quad \flat^{-1}(\sigma) \in \Gamma(TM))$$

chart: $g_{ab} = g_{ba}$

$$(g^{-1})^{am} g_{mb} = \delta_b^a$$

Example: $(S^2, \mathcal{O}, \mathcal{A})$

chart (\mathcal{U}, x)

$$\varphi \in (0, 2\pi)$$

$$\theta \in (0, \pi)$$

define the metric

$$g_{ij}(x^{-1}(\theta, \varphi)) = \begin{bmatrix} R^2 & 0 \\ 0 & R^2 \sin^2 \theta \end{bmatrix}_{ij}$$

$$R \in \mathbb{R}^+$$

"the metric of the round sphere of radius R "

10.2. **Signature.** Linear algebra:

$$A^a{}_m v^m = \lambda v^a$$
$$g_{am} v^m = \lambda \cdot v^a? \rightsquigarrow$$

$$\begin{pmatrix} \lambda_1 & & & & 0 \\ & \ddots & & & \\ 0 & & & & \lambda_n \\ & & 1 & & \\ & & & -1 & \\ & & & & \ddots \\ & & & & & -1 \\ & & & & & & 0 \\ & & & & & & & \ddots \\ & & & & & & & & 0 \end{pmatrix}$$

(1,1) tensor has eigenvalues
(0,2) has signature (p,q) (well-defined)

$$\left. \begin{matrix} (+ + +) \\ (+ + -) \\ (+ - -) \\ (- - -) \end{matrix} \right\} d + 1 \text{ if } p + q = \dim V$$

Definition 30. A metric is called **Riemannian** if its signature is $(+ + \cdots +)$
Lorentzian if $(+ - \cdots -)$

10.3. **Length of a curve.** Let γ be a smooth curve.
Then we know its veloctiy $v_{\gamma,\gamma(\lambda)}$ at each $\gamma(\lambda) \in M$.

Definition 31. On a Riemannian metric manifold $M, \mathcal{O}, \mathcal{A}, g)$, the **speed** of a curve at $\gamma(\lambda)$ is the number

$$(\sqrt{g(v_\gamma, v_\gamma)})_{\gamma(\lambda)} = s(\lambda)$$

F. Schuller: “I feel the need for speed.” -Top Gun.
(I feel the need for speed, then I feel the need for a metric)
Aside: $[v^a] = \frac{1}{T}$
 $[g_{ab}] = L^2$
 $[\sqrt{g_{ab}v^av^b}] = \sqrt{\frac{L^2}{T^2}} = \frac{L}{T}$

Definition 32. Let $\gamma : (0,1) \rightarrow M$ a smooth curve.
Then the **length of** γ is the number

$$\mathbb{R} \ni L[\gamma] := \int_0^1 d\lambda s(\lambda) = \int_0^1 d\lambda \sqrt{(g(v_\gamma, v_\gamma))_{\gamma(\lambda)}}$$

F. Schuller: “velocity is more fundamental than speed, speed is more fundamental than length”
Example: reconsider the round sphere of radius R
Consider its equator:
 $\theta(\lambda) := (x^1 \circ \gamma)(\lambda) = \frac{\pi}{2}$
 $\varphi(\lambda) := (x^2 \circ \gamma)(\lambda) = 2\pi\lambda^3$
 $\theta'(\lambda) = 0$
 $\varphi'(\lambda) = 6\pi\lambda^2$

on the same chart $g_{ij} = \begin{bmatrix} R^2 & \\ & R^2 \sin^2 \theta \end{bmatrix}$
F.Schuller: do everything in this chart

$$\begin{aligned} L[\gamma] &= \int_0^1 d\lambda \sqrt{g_{ij}(x^{-1}(\theta(\lambda), \varphi(\lambda)))(x^i \circ \gamma)'(\lambda)(x^j \circ \gamma)'(\lambda)} = \int_0^1 d\lambda \sqrt{R^2 \cdot 0 + R^2 \sin^2(\theta(\lambda))} 36\pi^2 \lambda^4 = \\ &= 6\pi R \int_0^1 d\lambda \lambda^2 = 6\pi R [\frac{1}{3}\lambda^3]_0^1 = 2\pi R \end{aligned}$$

Theorem 4. $\gamma : (0,1) \rightarrow M$ and
 $\sigma : (0,1) \rightarrow (0,1)$ *smooth bijective and increasing* “reparametrization”

$$L[\gamma] = L[\gamma \circ \sigma]$$

Proof. \implies Tutorials

□

10.4. **Geodesics.**

Definition 33. A curve $\gamma : (0,1) \rightarrow M$ is called a **geodesic** on a Riemannian manifold $(M, \mathcal{O}, \mathcal{A}, g)$ if its a stationary curve with respect to a length functional L .

Thought bubble: in classical mechanics, deform the curve a little, ϵ times this deformation, to first order, it agrees with $L[\gamma]$

Theorem 5. γ geodesic iff it satisfies the Euler-Lagrange equations for the Lagrangian

$$\begin{aligned} \mathcal{L} : TM &\rightarrow \mathbb{R} \\ X &\mapsto \sqrt{g(X, X)} \end{aligned}$$

In a chart, the Euler Lagrange equations take the form:

$$\left(\frac{\partial \mathcal{L}}{\partial \dot{x}^m}\right)^{\cdot} - \frac{\partial \mathcal{L}}{\partial x^m} = 0$$

F.Schuller: this is a chart dependent formulation
here:

$$\mathcal{L}(\gamma^i, \dot{\gamma}^i) = \sqrt{g_{ij}(\gamma(\lambda))\dot{\gamma}^i(\lambda)\dot{\gamma}^j(\lambda)}$$

Euler-Lagrange equations:

$$\begin{aligned} \frac{\partial \mathcal{L}}{\partial \dot{\gamma}^m} &= \frac{1}{\sqrt{\dots}} g_{mj}(\gamma(\lambda)) \dot{\gamma}^j(\lambda) \\ \left(\frac{\partial \mathcal{L}}{\partial \dot{\gamma}^m}\right)^{\cdot} &= \left(\frac{1}{\sqrt{\dots}}\right)^{\cdot} g_{mj}(\gamma(\lambda)) \cdot \dot{\gamma}^j(\lambda) + \frac{1}{\sqrt{\dots}} (g_{mj}(\gamma(\lambda)) \ddot{\gamma}^j(\lambda) + \dot{\gamma}^s (\partial_s g_{mj}) \dot{\gamma}^j(\lambda)) \end{aligned}$$

Thought bubble: reparametrize $g(\dot{\gamma}, \dot{\gamma}) = 1$ (it’s a condition on my reparametrization)
By a clever choice of reparametrization $(\frac{1}{\sqrt{\dots}})^{\cdot} = 0$

$$\frac{\partial \mathcal{L}}{\partial \gamma^m} = \frac{1}{2\sqrt{\dots}} \partial_m g_{ij}(\gamma(\lambda)) \dot{\gamma}^i(\lambda) \dot{\gamma}^j(\lambda)$$

putting this together as Euler-Lagrange equations:

$$g_{mj} \ddot{\gamma}^j + \partial_s g_{mj} \dot{\gamma}^s \dot{\gamma}^j - \frac{1}{2} \partial_m g_{ij} \dot{\gamma}^i \dot{\gamma}^j = 0$$

Multiply on both sides $(g^{-1})^{qm}$

$$\ddot{\gamma}^q + (g^{-1})^{qm}(\partial_i g_{mj} - \frac{1}{2}\partial_m g_{ij})\dot{\gamma}^i \dot{\gamma}^j = 0$$

$$\ddot{\gamma}^q + (g^{-1})^{qm}\frac{1}{2}(\partial_i g_{mj} + \partial_j g_{mi} - \partial_m g_{ij})\dot{\gamma}^i \dot{\gamma}^j = 0$$

geodesic equation for γ in a chart.

$$(g^{-1})^{qm}\frac{1}{2}(\partial_i g_{mj} + \partial_j g_{mi} - \partial_m g_{ij}) =: \Gamma^q_{ij}(\gamma(\lambda))$$

Thought bubble: $\left(\frac{\partial \mathcal{L}}{\partial \xi_x^{a+\dim M}}\right)_{\sigma(x)} - \left(\frac{\partial \mathcal{L}}{\partial x_i^a}\right)_{\sigma(x)} = 0$

Definition 34. “Christoffel symbol” ${}^{L.C.}\Gamma$ are the connection coefficient functions of the so-called Levi-Civita connection ${}^{L.C.}\nabla$

We usually make this choice of ∇ if g is given.

$$(M, \mathcal{O}, \mathcal{A}, g) \rightarrow (M, \mathcal{O}, \mathcal{A}, g, {}^{L.C.}\nabla)$$

abstract way: $\nabla g = 0$ and $T = 0$ (torsion)

$$\implies \nabla = {}^{L.C.}\nabla$$

Definition 35. (a) The Riemann-Christoffel curvature is defined by

$$R_{abcd} := g_{am}R^m_{bcd}$$

(b) Ricci: $R_{ab} = R^m_{amb}$

Thought bubble: with a metric, ${}^{L.C.}\nabla$

(c) (Ricci) scalar curvature:

$$R = g^{ab}R_{ab}$$

Thought bubble: ${}^{L.C.}\nabla$

Definition 36. Einstein curvature $(M, \mathcal{O}, \mathcal{A}, g)$

$$G_{ab} := R_{ab} - \frac{1}{2}g_{ab}R$$

Convention: $g^{ab} := (g^{“-1”})^{ab}$

F. Schuller: these indices are not being pulled up, because what would you pull them up with

(student) Question: Does the Einstein curvature yield new information?

Answer:

$$g^{ab}G_{ab} = R_{ab}g^{ab} - \frac{1}{2}g_{ab}g^{ab}R = R - \delta_a^a R = R - \frac{1}{2}\dim M R = (1 - \frac{d}{2})R$$

Tutorial 9: Metric manifolds. Exercise 3: Levi-Civita Connection. Suppose torsion-free $T = 0$ and metric-compatible connection $\nabla g = 0$

Question Recall $T = 0$ on a chart.

$$\Gamma^c_{ba} = \frac{1}{2}(g^{-1})^{cm}\left(\frac{\partial g_{bm}}{\partial x^a} + \frac{\partial g_{ma}}{\partial x^b} - \frac{\partial g_{ab}}{\partial x^m}\right)$$

or

$$\Gamma^a_{bc} = \frac{1}{2}(g^{-1})^{am}\left(\frac{\partial g_{bm}}{\partial x^c} + \frac{\partial g_{mc}}{\partial x^b} - \frac{\partial g_{bc}}{\partial x^m}\right)$$

11. SYMMETRY

EY : 20150321 This lecture tremendously and lucidly clarified, for me at least, what a symmetry of the Lie algebra is, and in comparing structures $(M, \mathcal{O}, \mathcal{A})$ vs. $(M, \mathcal{O}, \mathcal{A}, \nabla)$, clarified differences, and asking about differences is a good way to learn, the difference between \mathcal{L} and ∇ , respectively.

Feeling that the round sphere

$$(S^2, \mathcal{O}, \mathcal{A}, g^{\text{round}})$$

has rotational symmetry, while the potato

$$(S^2, \mathcal{O}, \mathcal{A}, g^{\text{potato}})$$

does not.

11.1.

11.2. Important

11.3. **Flow of a complete vector field.** Let $(M, \mathcal{O}, \mathcal{A})$ smooth X vector field on M

Definition 37. A curve $\gamma : I \subseteq \mathbb{R} \rightarrow M$ is called an integral curve of X if

$$v_{\gamma, \gamma(\lambda)} = X_{\gamma(\lambda)}$$

Definition 38. A vector filed X is **complete** if all integral curves have $I = \mathbb{R}$ EY: 20150321 (i.e. domain is all of \mathbb{R})

Ex. minute 48:30 EY : reall good explanation by F.P.Schuller; take a pt. out for an incomplete vector field.

Theorem 6. compactly supported smooth vector field is complete.

Definition 39. The flow of a complete vector field X is a 1-parameter family

$$h^X = \mathbb{R} \times M \rightarrow M$$

where $\gamma_p : \mathbb{R} \rightarrow M$ is the integral curve of X with

$$\gamma(0) = p$$

Then for fixed $\lambda \in \mathbb{R}$

$$h^X_\lambda : M \rightarrow M \text{ smooth}$$

picture $h^X_\lambda(S) \neq S$ (if $X \neq 0$)

11.4. **Lie subalgebras of the Lie algebra $(\Gamma(TM), [\cdot, \cdot])$ of vector fields.**

(a) $\Gamma(TM) = \{ \text{ set of all vector fields } \}$ $C^\infty(M)$ -module = \mathbb{R} -vector space

$$\implies [X, Y] \in \Gamma(TM) \qquad [X, Y]f := X(Yf) - Y(Xf)$$

(i) $[X, Y] = -[Y, X]$

(ii) $[\lambda X + Z, Y] = \lambda[X, Y] + [Z, Y]$

(iii) $[X, [Y, Z]] + [Z, [X, Y]] + [Y, [Z, X]] = 0$

$(\Gamma(TM), [\cdot, \cdot])$ Lie algebra

(b) Let $X_1 \dots X_s$ for s (many) vector fields on M , such that

Tutorial 11 Symmetry. Exercise 1. : True or false?

- (a)
 -
 - $\phi^*: T^*N \rightarrow T^*M$ i.e. $\phi^*\nu(X) = \nu(\phi_*X)$ for smooth $\phi: M \rightarrow N$, so the pullback of a covector $\nu \in T^*N$ maps to a covector in T^*M .
 -
 -
 -
 -
- (b)
- (c)

Exercise 2. : Pull-back and push-forward

Question . Let’s check this locally

$$\begin{aligned}\phi^*(df)(X) &= (df)(\phi_*X) = (df)(X^i \frac{\partial y^j}{\partial x^i} \frac{\partial}{\partial y^j}) = X^i \frac{\partial y^j}{\partial x^i} \frac{\partial f}{\partial y^j} \text{ where } \phi_*X = X^i \frac{\partial y^j}{\partial x^i} \frac{\partial}{\partial y^j} \\ d(\phi^*f)(X) &= d(f(\phi))(X) = \frac{\partial f}{\partial y^j} \frac{\partial y^j}{\partial x^i} dx^i(X) = X^i \frac{\partial y^j}{\partial x^i} \frac{\partial f}{\partial y^j}\end{aligned}$$

So

$\phi^*(df) = d(\phi^*f)$

$\forall p \in M, \forall X \in \mathfrak{X}(M)$

The big idea is that this is a showing of the **naturality** of the pullback ϕ^* with d , i.e. that this commutes:

$\Omega^1(M)$

$d \uparrow$

$C^\infty(M)$

$\xleftarrow{\phi^*} \Omega^1(N)$

$d \uparrow$

$\xleftarrow{\phi^*} C^\infty(N)$

Question .

$(\phi_*)^a_b := (dy^a)(\phi_*(\frac{\partial}{\partial x^b}))$

Let $g \in C^\infty(N)$

$$\begin{aligned}\phi_*\left(\frac{\partial}{\partial x^b}\right)g &= \frac{\partial x^b}{g}\phi(p) = \frac{\partial}{\partial x^b}g\phi x^{-1}x(p) = \frac{\partial}{\partial x^b}(gyy^{-1}\phi x^{-1})(x) = \\ &= \frac{\partial}{\partial x^b}(gy^{-1}(y\phi x^{-1}(x(p)))) = \frac{\partial g}{\partial y}\bigg|_y \frac{\partial y^a}{\partial x^b}\bigg|_x = \frac{\partial y^a}{\partial x^b} \frac{\partial g}{\partial y^a}\end{aligned}$$

Then

$$\phi_*\left(\frac{\partial}{\partial x^b}\right) = \frac{\partial y^a}{\partial x^b} \frac{\partial}{\partial y^a}$$

and so

$$(\phi_*)^a_b = \frac{\partial y^a}{\partial x^b}$$

Question .

Exercise 3. :Lie derivative-the pedestrian way

Question . While it is true that $\forall p \in S^2$, for $x(p) = (\theta, \varphi)$, and $(yix^{-1})(\theta, \varphi) = (y^1, y^2, y^3) \in \mathbb{R}^3$ and that, at this point

p , $(y^1)^2/a^2 + (y^2)^2/b^2 + (y^3)^2/c^3 = 1$, this doesn’t imply (EY: 20150321 I think) that, globally, it’s an ellipsoid (yet). In the familiar charts given, spherical chart $(U, x) \in \mathcal{A}$ and $(\mathbb{R}^3, y = \text{id}_{\mathbb{R}^3}) \in \mathcal{B}$ it looks like an ellipsoid, but change to another choice of charts, and it could look something very different.

Question .

Equip $(\mathbb{R}^3, \mathcal{O}_{\text{st}}, \mathcal{B})$ with the Euclidean metric g , and pullback g .
Note that the pullback of the inclusion from \mathbb{R}^3 onto S^2 for the Euclidean metric is the following:

$$i^*g\left(\frac{\partial}{\partial \theta^i}, \frac{\partial}{\partial \theta^j}\right) = g\left(i_*\frac{\partial}{\partial \theta^i}, i_*\frac{\partial}{\partial \theta^j}\right) = g\left(\frac{\partial x^a}{\partial \theta^i} \frac{\partial}{\partial x^a}, \frac{\partial x^b}{\partial \theta^j} \frac{\partial}{\partial x^b}\right) = g_{ab} \frac{\partial x^a}{\partial \theta^i} \frac{\partial x^b}{\partial \theta^j}$$

With $g_{ab} = \delta_{ab}$, the usual Euclidean metric, this becomes the following:

$$g_{ij}^{\text{ellipsoid}} = \frac{\partial x^a}{\partial \theta^i} \frac{\partial x^a}{\partial \theta^j}$$

At this point, one should get smart (we are in the 21st century) and use some sort of CAS (Computer Algebra System). I like Sage Math (version 6.4 as of 20150322). I also like the Sage Manifolds package for Sage Math.
I like Sage Math for the following reasons:

- Open source, so it’s open and freely available to anyone, which fits into my principle of making online education open and freely available to anyone, anytime
- Sage Math structures everything in terms of Category Theory and Categories and Morphisms naturally correspond to Classes and Class methods or functions in Object-Oriented Programming in Python and they’ve written it that way

and I like Sage Manifolds for roughly the same reasons, as manifolds are fit into a category theory framework that’s written into the Python code. e.g.

```
sage: S2 = Manifold(2, 'S^2', r'\mathbb{S}^2', start_index=1) ; print S2
sage: print S2
2-dimensional manifold 'S^2'
sage: type(S2)
<class 'sage.geometry.manifolds.manifold.Manifold_with_category'>
```

With code (I’ve provided for convenience; you can make your own as I wrote it based upon to example of S^2 on the sage-manifolds documentation website page), load it and do the following:

cf. <https://github.com/ernestyalumni/diffgeo-by-sagemnfd/blob/master/S2.sage>
<http://sagemanifolds.obspm.fr/examples.html>

```
sage: load("S2.sage")
sage: U_ep = S2.open_subset('U_{ep}')
sage: eps.<the,phi> = U_ep.chart()
sage: a = var(\a")
sage: b = var(\b")
sage: c = var("c")
sage: inclus = S2.diff_mapping(R3, {(eps, cart): [ a*cos(phi)*sin(the), b*sin(phi)*sin(the),c*cos(the) ]} , name="inc", latex_name=r'\mathcal{i}')
sage: inclus.pullback(h).display()
inc_*(h) = (c^2*sin(the)^2 + (a^2*cos(phi)^2 + b^2*sin(phi)^2)*cos(the)^2) dthe*dthe - (a^2 - b^2)*cos(phi)*cos(the)*sin(phi)*sin(the) dthe*dphi - (a^2 - b^2)*cos(phi)*cos(the)*sin(phi)*sin(the) dphi*dthe + (b^2*cos(phi)^2 + a^2*sin(phi)^2)*sin(the)^2 dphi*dphi
sage: inclus.pullback(h)[2,2].expr()
(b^2*cos(phi)^2 + a^2*sin(phi)^2)*sin(the)^2
```

A new open subset U_{ep} was declared in S^2 , a new chart $(U_{\text{ep}},(\theta,\phi))$ was declared, the constants, a,b,c , were declared, and the inclusion map given in the problem

$$y\circ i\circ x^{-1}:(\theta,\phi)\mapsto(a\cos\phi\sin\theta,b\sin\phi\sin\theta,c\cos\theta)$$

Then the pullback of the inclusion map γ was done on the Euclidean metric h , defined earlier in the file

`S2.sage`

. Then one can access the components of this metric and do, for example,

`simplify_full()`, `full_simplify()`, `reduce_trig()`

on the expression.

In Python, I could easily do this, and give an answer quick in LaTeX:

```
sage: for i in range(1,3):
....:     for j in range(1,3):
....:         print inclus.pullback(h)[i,j].expr()
....:         latex(inclus.pullback(h)[i,j].expr() )
....:
c^2*sin(the)^2 + (a^2*cos(phi)^2 + b^2*sin(phi)^2)*cos(the)^2
```

(EY: I'll suppress the LaTeX output but this sage math function gives you LaTeX code) and so

$$\begin{aligned} i^*g &= c^2 \sin (the)^2 + \left(a^2 \cos (\phi)^2 + b^2 \sin (\phi)^2\right) \cos (the)^2 d\theta \otimes d\theta + \\ &\quad -2\left(a^2-b^2\right) \cos (\phi) \cos (the) \sin (\phi) \sin (the) d\theta \otimes d\phi + \\ &\quad +\left(b^2 \cos (\phi)^2 + a^2 \sin (\phi)^2\right) \sin (the)^2 d\phi \otimes d\phi \end{aligned}$$

Question .

```
sage: polar_vees = eps.frame()
sage: X_1 = - sin(phi) * polar_vees[1] - cot( the ) * cos(phi) * polar_vees[2]
sage: X_2 = cos( phi ) * polar_vees[1] - cot( the ) * sin( phi) * polar_vees[2]
sage: X_3 = polar_vees[2]
sage: X_2.lie_der(X_1).display()
(cos(the)^2 - 1)/sin(the)^2 d/dphi
sage: X_3.lie_der(X_1).display()
cos(phi) d/dthe - cos(the)*sin(phi)/sin(the) d/dphi
sage: X_3.lie_der(X_2).display()
sin(phi) d/dthe + cos(phi)*cos(the)/sin(the) d/dphi
```

Indeed, one can check on a scalar field $f_{\text{eps}} \in C^\infty(S^2)$:

```
sage: f_eps = S2.scalar_field({eps: function('f', the, phi ) }, name='f' )
sage: (X_1( X_2(f_eps)) - X_2(X_1(f_eps) ) ).display()
U_{ep} --> R
(the, phi) |--> -D[1](f)(the, phi)
sage: X_2.lie_der(X_1) == -X_3
True
sage: X_3.lie_der(X_1) == X_2
True
sage: X_3.lie_der(X_2) == -X_1
True
```

$$\implies \boxed{[X_i,X_j] = -\epsilon_{ijk}X_k}$$

So $\text{span}_{\mathbb{R}}\{X_1,X_2,X_3\}$ equipped with $[\, , \,]$ constitute a Lie subalgebra on S^2 (It's closed under $[\, , \,]$)

12. INTEGRATION

12.1.

12.2.

12.3. Volume forms.

Definition 40. *On a smooth manifold $(M,\mathcal{O},\mathcal{A})$ a $(0,\dim M)$ -tensor field Ω is called a volume form if*

- (a) Ω *vanishes nowhere* (i.e. $\Omega \neq 0 \, \forall p \in M$)
- (b) *totally antisymmetric*

$$\Omega(\ldots,\underbrace{X}_{ith},\ldots,\underbrace{Y}_{jth}\ldots)=-\Omega(\ldots,\underbrace{Y}_{ith},\ldots,\underbrace{X}_{jth}\ldots)$$

In a chart:

$$\Omega_{i_1\ldots i_d}=\Omega_{[i_1\ldots i_d]}$$

Example $(M,\mathcal{O},\mathcal{A},g)$ metric manifold
construct volume form Ω from g
In any chart: (U,x)

$$\Omega_{i_1\ldots i_d}:=\sqrt{\det(g_{ij}(x))}\epsilon_{i_1\ldots i_d}$$

where **Levi-Civita symbol** $\epsilon_{i_1\ldots i_d}$ is defined as $\epsilon_{123\ldots d}=+1$

$$\epsilon_{1\ldots d}=\epsilon_{[i_1\ldots i_d]}$$

Proof. (well-defined) Check: What happens under a change of charts

$$\begin{aligned} \Omega(y)_{i_1\ldots i_d} &= \sqrt{\det(g(y)_{ij})}\epsilon_{i_1\ldots i_d} = \\ &= \sqrt{\det(g_{mn}(x)\frac{\partial x^m}{\partial y^i}\frac{\partial x^n}{\partial y^j})}\frac{\partial y^{m_1}}{\partial x^{i_1}}\cdots\frac{\partial y^{m_d}}{\partial x^{i_d}}\epsilon_{[m_1\ldots m_d]} = \\ &= \sqrt{|\det g_{ij}(x)|}\left|\det\left(\frac{\partial x}{\partial y}\right)\right|\det\left(\frac{\partial y}{\partial x}\right)\epsilon_{i_1\ldots i_d} = \sqrt{\det g_{ij}(x)}\epsilon_{i_1\ldots i_d}\text{sgn}\left(\det\left(\frac{\partial x}{\partial y}\right)\right) \end{aligned}$$

□

EY : 20150323

Consider the following:

$$\begin{aligned}\Omega(y)(Y_{(1)} \dots Y_{(d)}) &= \Omega(y)_{i_1 \dots i_d} Y_{(1)}^{i_1} \dots Y_{(d)}^{i_d} = \\ &= \sqrt{\det(g_{ij}(y))} \epsilon_{i_1 \dots i_d} Y_{(1)}^{i_1} \dots Y_{(d)}^{i_d} = \\ &= \sqrt{\det(g_{mn}(x))} \frac{\partial x^m}{\partial y^i} \frac{\partial x^n}{\partial y^j} \epsilon_{i_1 \dots i_d} \frac{\partial y^{i_1}}{\partial x^{m_1}} \dots \frac{\partial y^{i_d}}{\partial x^{m_d}} X^{m_1} \dots X^{m_d} = \\ &= \sqrt{\det(g_{mn}(x))} \frac{\partial x^m}{\partial y^i} \frac{\partial x^n}{\partial y^j} \det\left(\frac{\partial y}{\partial x}\right) \epsilon_{m_1 \dots m_d} X^{m_1} \dots X^{m_d} = \\ &= \sqrt{\det(g_{mn}(x))} \left| \det\left(\frac{\partial x}{\partial y}\right) \right| \det\left(\frac{\partial y}{\partial x}\right) \epsilon_{m_1 \dots m_d} X^{m_1} \dots X^{m_d} = \\ &= \sqrt{\det(g_{mn}(x))} \epsilon_{m_1 \dots m_d} \operatorname{sgn}\left(\det\left(\frac{\partial x}{\partial y}\right)\right) X^{m_1} \dots X^{m_d} = \operatorname{sgn}(\det\left(\frac{\partial x}{\partial y}\right)) \Omega_{m_1 \dots m_d}(x) X^{m_1} \dots X^{m_d}\end{aligned}$$

If $\det\left(\frac{\partial y}{\partial x}\right) > 0$,

$$\Omega(y)(Y_{(1)} \dots Y_{(d)}) = \Omega(x)(X_{(1)} \dots X_{(d)})$$

This works also if Levi-Civita symbol $\epsilon_{i_1 \dots i_d}$ doesn't change at all under a change of charts. (around 42:43 <https://youtu.be/2XpnbvPy-Zg>)

Alright, let's require,
restrict the smooth atlas \mathcal{A}
to a subatlas (\mathcal{A}^\uparrow still an atlas)

$$\mathcal{A}^\uparrow \subseteq \mathcal{A}$$

s.t. $\forall (U, x), (V, y)$ have chart transition maps $y \circ x^{-1}$
 $x \circ y^{-1}$

s.t. $\det\left(\frac{\partial y}{\partial x}\right) > 0$
such \mathcal{A}^\uparrow called an **oriented** atlas

$$(M, \mathcal{O}, \mathcal{A}, g) \implies (M, \mathcal{O}, \mathcal{A}^\uparrow, g)$$

Note: associated bundles.
Note also: $\det\left(\frac{\partial y^b}{\partial x^a}\right) = \det(\partial_a(y^b x^{-1}))$ $\frac{\partial y^b}{\partial x^a}$ is an endomorphism on vector space V .

$\varphi: V \rightarrow V$
 $\det \varphi$ independent of choice of basis
 g is a $(0, 2)$ tensor field, not endomorphism (not independent of choice of basis) $\sqrt{|\det(g_{ij}(y))|}$

Definition 41. Ω be a volume form on $(M, \mathcal{O}, \mathcal{A}^\uparrow)$ and consider chart (U, x)

Definition 42. $\omega_{(X)} := \Omega_{i_1 \dots i_d} \epsilon^{i_1 \dots i_d}$ same way $\epsilon^{12 \dots d} = +1$
 $\epsilon^{[\dots]}$

one can show

$$\omega_{(y)} = \det\left(\frac{\partial x}{\partial y}\right) \omega_{(x)}$$

scalar density

12.4. **Integration on one chart domain U .**

Definition 43.

(7)

$$\int_U f : \stackrel{(U,y)}{=} \int_{y(U)} d^d \beta \omega_{(y)}(y^{-1}(\beta)) f_{(y)}(\beta)$$

Proof. : Check that it's (well-defined), how it changes under change of charts

$$\begin{aligned}\int_U f : \stackrel{(U,y)}{=} \int_{y(U)} d^d \beta \omega_{(y)}(y^{-1}(\beta)) f_{(y)}(\beta) &= \stackrel{(U,y)}{=} \int_{x(U)} \int d^d \alpha \left| \det\left(\frac{\partial y}{\partial x}\right) \right| f_{(x)}(\alpha) \omega_{(x)}(x^{-1}(\alpha)) \det\left(\frac{\partial x}{\partial y}\right) = \\ &= \int_{x(U)} d^d \alpha \omega_{(x)}(x^{-1}(x)) f_{(x)}(\alpha)\end{aligned}$$

□

On an oriented metric manifold $(M, \mathcal{O}, \mathcal{A}^\uparrow, g)$

$$\int_U f := \int_{x(U)} d^d \alpha \underbrace{\sqrt{\det(g_{ij}(x))(x^{-1}(\alpha))}}_{\sqrt{g}} f_{(x)}(\alpha)$$

12.5. **Integration on the entire manifold.**

13. LECTURE 13: RELATIVISTIC SPACETIME

Recall, from Lecture 9, the definition of Newtonian spacetime

$$(M, \mathcal{O}, \mathcal{A}, \nabla, t)$$

$$\begin{aligned}&\nabla \text{ torsion free} \\ &t \in C^\infty(M) \\ &dt \neq 0 \\ &\nabla dt = 0 \quad (\text{uniform time})\end{aligned}$$

and the definition of relativistic spacetime (before Lecture)

$$(M, \mathcal{O}, \mathcal{A}^\uparrow, \nabla, g, T)$$

$$\begin{aligned}&\nabla \text{ torsion-free} \\ &g \text{ Lorentzian metric}(+ - - -) \\ &T \text{ time-orientation}\end{aligned}$$

13.1. **Time orientation.**

Definition 44. $(M, \mathcal{O}, \mathcal{A}^\uparrow, g)$ a Lorentzian manifold. Then a time-orientation is given by a vector field T that

- (i) does **not** vanish anywhere
- (ii) $g(T, T) > 0$

Newtonian vs. relativistic

Newtonian

X was called future-directed if

$$dt(X) > 0$$

$\forall p \in M$, take half plane, half space of $T_p M$
also stratified atlas so make planes of constant t straight
relativistic

half cone $\forall p,q \in M$, half-cone $\subseteq T_pM$

This definition of spacetime
Question

I see how the cone structure arises from the new metric. I don’t understand however, how the T , the time orientation, comes in

Answer
 $(M,\mathcal{O},\mathcal{A},g)$ $g \stackrel{(\cdot)}{\leftarrow} + - - -$
requiring $g(X,X) > 0$, select cones
 T chooses which cone

This definition of spacetime has been made to enable the following physical postulates:

- (P1) The worldline γ of a massive particle satisfies
- (i) $g_{\gamma(\lambda)}(v_{\gamma,\gamma(lambda)},v_{\gamma,\gamma(\lambda)}) > 0$
 - (ii) $g_{\gamma(\lambda)}(T,v_{\gamma,\gamma(\lambda)}) > 0$
- (P2) Worldlines of massless particles satisfy
- (i) $g_{\gamma(\lambda)}(v_{\gamma,\gamma(\lambda)},v_{\gamma,\gamma(\lambda)}) = 0$
 - (ii) $g_{\gamma(\lambda)}(T,v_{\gamma,\gamma(\lambda)}) > 0$
- picture: spacetime:

Answer (to a question) T is a smooth vector field, T determines future vs. past, “general relativity: we have such a time orientation; smoothness makes it less arbitrary than it seems” -FSchuller,
Claim: 9/10 of a metric are determined by the cone
spacetime determined by distribution, only one-tenth error

13.2. **Observers.** $(M,\mathcal{O},\mathcal{A}^\uparrow,\nabla,g,T)$

Definition 45. An observer is a worldline γ with

$$\begin{aligned} g(v_\gamma,v_\gamma) &> 0 \\ g(T,v_\gamma) &> 0 \end{aligned}$$

together with a choice of basis

$$v_{\gamma,\gamma(\lambda)} \equiv e_0(\lambda),e_1(\lambda),e_2(\lambda),e_3(\lambda)$$
$$\text{of each }T_{\gamma(\lambda)}M \text{ where the observer worldline passes, if }g(e_a(\lambda),e_b(\lambda)) = \eta_{ab} = \left[\begin{array}{cccc} 1 & & & \\ & -1 & & \\ & & -1 & \\ & & & -1 \end{array} \right]_{ab}$$

precise: observer = smooth curve in the frame bundle LM over M

13.2.1. *Two physical postulates.*

- (P3) A **clock** carried by a specific observer (γ,e) will measure a **time**

$$\tau := \int_{\lambda_0}^{\lambda_1} d\lambda \sqrt{g_{\gamma(\lambda)}(v_{\gamma,\gamma(\lambda)},v_{\gamma,\gamma(\lambda)})}$$

between the two “ <u>events</u> ”	$\gamma(\lambda_0)$	“start the clock”
and	$\gamma(\lambda_1)$	“stop the clock”

Compare with Newtonian spacetime:

$$t(p) = 7$$

Thought bubble: proper time/eigentime τ

$$\begin{aligned} M &= \mathbb{R}^4 \\ \mathcal{O} &= \mathcal{O}_{\text{st}} \\ \text{Application/Example. } \mathcal{A} &\ni (\mathbb{R}^4,\text{id}_{\mathbb{R}^4}) \\ g : g_{(x)ij} &= \eta_{ij} \quad ; \quad T^i_{(x)} = (1,0,0,0)^i \\ &\implies \Gamma^i_{(x) \ jk} = 0 \text{ everywhere} \end{aligned}$$

$$\implies (M,\mathcal{O},\mathcal{A}^\uparrow,g,T,\nabla) \quad \text{Riem} = 0$$

\implies spacetime is flat

This situation is called special relativity.

Consider two observers:

$$\begin{aligned} \gamma : (0,1) &\rightarrow M \\ \gamma^i_{(x)} &= (\lambda,0,0,0)^i \\ \delta : (0,1) &\rightarrow M \\ \alpha \in (0,1) : \delta^i_{(x)} &= \begin{cases} (\lambda,\alpha\lambda,0,0)^i & \lambda \leq \frac{1}{2} \\ (\lambda,(1-\lambda)\alpha,0,0)^i & \lambda > \frac{1}{2} \end{cases} \end{aligned}$$

let’s calculate:

$$\begin{aligned} \tau_\gamma &:= \int_0^1 \sqrt{g_{(x)ij} \dot{\gamma}^i_{(x)} \dot{\gamma}^j_{(x)}} = \int_0^1 d\lambda 1 = 1 \\ \tau_\delta &:= \int_0^{1/2} d\lambda \sqrt{1-\alpha^2} + \int_{1/2}^1 \sqrt{1^2 - (-\alpha)^2} = \int_0^1 \sqrt{1-\alpha^2} = \sqrt{1-\alpha^2} \end{aligned}$$

Note: piecewise integration

Taking the clock postulate (P3) seriously, one better come up with a realistic clock design that supports the postulate.
idea.

2 little mirrors

- (P4) Postulate

Let (γ,e) be an observer, and

δ be a *massive* particle worldline that is parametrized s.t. $g(v_\gamma,v_\gamma) = 1$ (for parametrization/normalization convenience)

Suppose the observer and the particle *meet* somewhere (in spacetime)

$$\delta(\tau_2) = p = \gamma(\tau_1)$$

This observer measures the 3-velocity (spatial velocity) of this particle as

$$(8) \qquad v_\delta : \epsilon^\alpha(v_{\delta,\delta(\tau_2)})e_\alpha \qquad \alpha = 1,2,3$$

where $\epsilon^0, \boxed{\epsilon^1,\epsilon^2,\epsilon^3}$ is the unique dual basis of $e_0, \boxed{e_1,e_2,e_3}$

EY:20150407

There might be a major correction to Eq. (8) from the Tutorial 14 : Relativistic spacetime, matter, and Gravitation, see the second exercise, Exercise 2, third question:

$$(9) \qquad v := \frac{\epsilon^\alpha(v_\delta)}{\epsilon^0(v_\delta)}e_\alpha$$

Consequence: An observer (γ,e) will extract quantities measurable in his laboratory from objective spacetime quantities always like that.

Ex: F Faraday (0,2)-tensor of electromagnetism:

$$F(e_a, e_b) = F_{ab} = \begin{bmatrix} 0 & E_1 & E_2 & E_3 \\ -E_1 & 0 & B_3 & -B_2 \\ -E_2 & -B_3 & 0 & B_1 \\ -E_3 & B_2 & -B_1 & 0 \end{bmatrix}$$

observer frame e_a, e_b
 $E_\alpha := F(e_0, e_\alpha)$
 $B^\gamma := F(e_\alpha, e_\rho)\epsilon^{\alpha\beta\gamma}$ where $\epsilon^{123} = +1$ totally antisymmetric

13.3. Role of the Lorentz transformations. Lorentz transformations emerge as follows:
Let (γ, e) and $(\tilde{\gamma}, \tilde{e})$ be observers with $\gamma(\tau_1) = \tilde{\gamma}(\tau_2)$
(for simplicity $\gamma(0) = \tilde{\gamma}(0)$)
Now

$$\begin{array}{ll} e_0, \dots, e_1 & \text{at } \tau = 0 \\ \text{and } \tilde{e}_0, \dots, \tilde{e}_1 & \text{at } \tau = 0 \end{array}$$

both bases for the same $T_{\gamma(0)}M$
Thus: $\tilde{e}_a = \Lambda^b_a e_b$ $\Lambda \in GL(4)$
Now:

$$\begin{aligned} \eta_{ab} = g(\tilde{e}_a, \tilde{e}_b) &= g(\Lambda^m_a e_m, \Lambda^n_b e_n) = \\ &= \Lambda^m_a \Lambda^n_b \underbrace{g(e_m, e_n)}_{\eta_{mn}} \end{aligned}$$

i.e. $\Lambda \in O(1, 3)$
Result: Lorentz transformations relate the *frames* of *any two observers* at the same point.
“ $\tilde{x}^\mu - \Lambda^\mu_\nu x^\nu$ ” is utter nonsense

Tutorial. I didn’t see a tutorial video for this lecture, but I saw that the Tutorial sheet number 14 had the relevant topics. Go there.

14. LECTURE 14: MATTER

- two types of matter
- point matter
- field matter
- point matter
- massive point particle
- more of a phenomenological importance
- field matter
- electromagnetic field
- more fundamental from the GR point of view
- both classical matter types

14.1. Point matter. Our postulates (P1) and (P2) already constrain the possible particle worldlines.
But what is their precise law of motion, possibly in the presence of “forces”,
(a) without external forces

$$S_{\text{massive}}[\gamma] := m \int d\lambda \sqrt{g_{\gamma(\lambda)}(v_{\gamma, \gamma(\lambda)}, v_{\gamma, \gamma(\lambda)})}$$

with:

$$g_{\gamma(\lambda)}(T_{\gamma(\lambda)}, v_{\gamma, \gamma(\lambda)}) > 0$$

dynamical law Euler-Lagrange equation

similarly

$$\begin{array}{ll} S_{\text{massless}}[\gamma, \mu] = \int d\lambda \mu g(v_{\gamma, \gamma(\lambda)}, v_{\gamma, \gamma(\lambda)}) \\ \delta_\mu & g(v_{\gamma, \gamma(\lambda)}, v_{\gamma, \gamma(\lambda)}) = 0 \\ \delta_\gamma & \text{e.o.m.} \end{array}$$

Reason for describing equations of motion by actions is that composite systems have an action that is the sum of the actions of the parts of that system, possibly including “interaction terms.”
Example.

$$S[\gamma] + S[\delta] + S_{\text{int}}[\gamma, \delta]$$

(b) presence of external forces
or rather presence of fields to which a particle “couples”
Example

$$S[\gamma; A] = \int d\lambda m \sqrt{g_{\gamma(\lambda)}(v_{\gamma, \gamma(\lambda)}, v_{\gamma, \gamma(\lambda)})} + qA(v_{\gamma, \gamma(\lambda)})$$

where A is a **covector field** on M . A fixed (e.g. the electromagnetic potential)
Consider Euler-Lagrange eqns. $L_{\text{int}} = qA_{(x)}\dot{\gamma}^m_{(x)}$

$$m(\nabla_{v_\gamma} v_\gamma)_a + \underbrace{\left(\frac{\partial L_{\text{int}}}{\partial \dot{\gamma}^m_{(x)}} \right)}_* - \frac{\partial L_{\text{int}}}{\partial \gamma^m_{(x)}} = 0 \implies \boxed{\begin{array}{l} m(\nabla_{v_\gamma} v_\gamma)^a = \underbrace{-qF^a_m \dot{\gamma}^m}_{\text{Lorentz force on a charged particle in an electromagnetic field}} \end{array}}$$

$$\begin{aligned} \frac{\partial L}{\partial \dot{\gamma}^a} &= qA_{(x)a}, & \left(\frac{\partial L}{\partial \dot{\gamma}^m_{(x)}} \right) &= q \cdot \frac{\partial}{\partial x^m}(A_{(x)m}) \cdot \dot{\gamma}^m_{(x)} \\ \frac{\partial L}{\partial \gamma^a} &= q \cdot \frac{\partial}{\partial x^a}(A_{(x)m}) \dot{\gamma}^m \\ * &= q \left(\frac{\partial A_a}{\partial x^m} - \frac{\partial A_m}{\partial x^a} \right) \dot{\gamma}^m_{(x)} = q \cdot F_{(x)am} \dot{\gamma}^m_{(x)} \end{aligned}$$

$F \leftarrow$ Faraday

$$S[\gamma] = \int (m\sqrt{g(v_\gamma, v_\gamma)} + qA(v_\gamma))d\lambda$$

14.2. Field matter.

Definition 46. *Classical (non-quantum) field matter is any tensor field on spacetime where equations of motion derive from an action.*

Example:

$$S_{\text{Maxwell}}[A] = \frac{1}{4} \int_M d^4x \sqrt{-g} F_{ab} F_{cd} g^{ac} g^{bd}$$

A (0,1)-tensor field
= thought cloud: for simplicity one chart covers all of M
– for $\sqrt{-g}$ (+ – – –)

$$F_{ab} := 2\partial_{[a}A_{b]} = 2(\nabla_{[a}A_{b]})$$

Euler-Lagrange equations for fields

$$0 = \frac{\partial \mathcal{L}}{\partial A_m} - \frac{\partial}{\partial x^s} \left(\frac{\partial \mathcal{L}}{\partial \partial_s A_m} \right) + \frac{\partial}{\partial x^s} \frac{\partial}{\partial x^t} \frac{\partial^2 \mathcal{L}}{\partial \partial_t \partial_s A_m}$$

Example . . .

inhomogeneous Maxwell
thought bubble $j = qv_\gamma$

$$(\nabla_{\frac{\partial}{\partial x^m}} F)^{ma} = j^a$$

$$\partial_{[a}F_{b]} - ()$$

homogeneous Maxwell
Other example well-liked by textbooks

$$S_{\text{Klein-Gordon}}[\phi] := \int_M d^4x \sqrt{-g} [g^{ab}(\partial_a \phi)(\partial_b \phi) - m^2 \phi^2]$$

ϕ (0,0)-tensor field

14.3. Energy-momentum tensor of matter fields. At some point, we want to write down an action for the metric tensor field itself.

But then, this action $S_{\text{grav}}[g]$ will be added to any $S_{\text{matter}}[A, \phi, \dots]$ in order to describe the total system.

$$S_{\text{total}}[g, A] = S_{\text{grav}}[g] + S_{\text{Maxwell}}[A, g]$$

$$\delta A \quad \implies \text{Maxwell's equations}$$

$$\delta g_{ab} \quad : \quad \boxed{\frac{1}{16\pi G} G^{ab}} + (-2T^{ab}) = 0$$

G Newton’s constant

$$G^{ab} = 8\pi G_N T^{ab}$$

Definition 47. $S_{\text{matter}}[\Phi, g]$ is a matter action, the ***so-called energy-momentum tensor*** is

$$T^{ab} := \frac{-2}{\sqrt{-g}} \left(\frac{\partial \mathcal{L}_{\text{matter}}}{\partial g_{ab}} - \partial_s \frac{\partial \mathcal{L}_{\text{matter}}}{\partial \partial_s g_{ab}} + \dots \right)$$

– of $\frac{-2}{\sqrt{g}}$ is Schrödinger minus (EY : 20150408 F.Schuller’s joke? but wise)
choose all sign conventions s.t.

$$T(\epsilon^0, \epsilon^0) > 0$$

Example: For S_{Maxwell} :

$$T_{ab} = F_{am}F_{bn}g^{mn} - \frac{1}{4}F_{mn}F^{mn}g_{ab}$$

$$T_{ab} \equiv T_{\text{Maxwell}ab}$$

$$T(e_0, e_0) = \underline{E}^2 + \underline{B}^2$$

$$T(e_0, e_\alpha) = (E \times B)_\alpha$$

Fact: One often does not specify the fundamental action for some matter, but one is rather satisfied to assume certain properties / forms of

$$T_{ab}$$

Example Cosmology: (homogeneous & isotropic)
perfect fluid

of pressure p and density ρ modelled by

$$T^{ab} = (\rho + p)u^a u^b - pg^{ab}$$

radiative fluid

What is a fluid of photons:

$$T_{\text{Maxwell}}^{ab}g_{ab} = 0$$

observe: $T_{\text{p.f.}}^{ab}g_{ab} \stackrel{!}{=} 0$

$$= (\rho + p)u^a u^b g_{ab} - p \underbrace{g^{ab}g_{ab}}_4$$

$$\leftrightarrow \rho_p 04p = 0$$

$$\rho = 3p$$

$$p = \tfrac{1}{3}\rho$$

Reconvene at 3 pm? (EY : 20150409 I sent a Facebook (FB) message to the International Winter School on Gravity and Light: there was no missing video; it continues on Lecture 15 immediately)

Tutorial 14: Relativistic Spacetime, Matter and Gravitation. Exercise 2: Lorentz force law.

Question electromagnetic potential.

15. LECTURE 15: EINSTEIN GRAVITY

Recall that in Newtonian spacetime, we were able to reformulate the Poisson law $\Delta\phi = 4\pi G_N \rho$ in terms of the Newtonian spacetime curvature as

$$R_{00} = 4\pi G_N \rho$$

R_{00} with respect to ∇_{Newton}

G_N = Newtonian gravitational constant

This prompted Einstein to postulate < 1915 that the relativistic field equations for the Lorentzian metric g of (relativistic) spacetime

$$R_{ab} = 8\pi G_N T_{ab} \text{✓}$$

However, this equation suffers from a problem

LHS: $(\nabla_a R)^{ab} \neq 0$

generically

RHS:

$$(\nabla_a T)^{ab} = 0$$

thought bubble: = formulated from an action

Einstein tried to argue this problem away.

Nevertheless, the equations cannot be upheld.

15.1. Hilbert. Hilbert was a specialist for variational principles.

To find the appropriate left hand side of the gravitational field equations, Hibert suggested to start from an action

$$S_{\text{Hilbert}}[g] = \int_M \sqrt{-g} R_{ab} g^{ab}$$

thought bubble = “simplest action”

aim: varying this w.r.t. metric g_{ab} will result in some tensor

$$G^{ab} = 0$$

15.2. Variation of S_{Hilbert} .

$$0 \stackrel{!}{=} \underbrace{\delta}_{g_i} S_{\text{Hilbert}}[g] = \int_M [\underbrace{\delta\sqrt{-g}g^{ab}R_{ab}}_1 + \underbrace{\sqrt{-g}\delta g^{ab}R_{ab}}_2 + \underbrace{\sqrt{-g}g^{ab}\delta R_{ab}}_3]$$

$$\text{and } 1 : \delta\sqrt{-g} = \frac{-(\det g)g^{mn}\delta g_{mn}}{2\sqrt{-g}} = \frac{1}{2}\sqrt{-g}g^{mn}\delta g_{mn}$$

thought bubble

$$\begin{aligned} \delta\det(g) &= \det(g)g^{mn}\delta g_{mn} \\ &\text{e.g. from} \\ \det(g) &= \exp \text{trln } g \end{aligned}$$

ad 2: $g^{ab}g_{bc} = \delta^a_c$

$$\begin{aligned} \implies (\delta g^{ab})g_{bc} + g^{ab}(\delta g_{bc}) &= 0 \\ \implies \delta g^{ab} &= -g^{am}g^{bn}\delta g_{mn} \end{aligned}$$

ad 3:

$$\begin{aligned} \Delta R_{ab} &\stackrel{\text{normal coords at point}}{=} \delta\partial_b\Gamma^m_{am} - \delta\partial_m\Gamma^m_{ab} + \Gamma\Gamma - \Gamma\Gamma = \\ &= \partial_b\delta\Gamma^m_{am} - \partial_m\delta\Gamma^m_{ab} = \\ &= \nabla_b(\delta\Gamma^m_{am}) - \nabla_m(\delta\Gamma^m_{ab}) \\ &\implies \sqrt{-g}g^{ab}\delta R_{ab} = \sqrt{-g} \end{aligned}$$

“if you formulate the variation properly, you’ll see the variation δ commute with ∂_b ” EY : 20150408 I think one uses the integration at the bounds, integration by parts trick

$\Gamma^i_{(x)jk} - \tilde{\Gamma}^i_{(x)jk}$ are the components of a (1,2)-tensor.

Notation: $(\nabla_b A)^i_g =: A^i_{j;b}$

$$\begin{aligned} &\implies \sqrt{-g}g^{ab}\delta R_{ab} \\ &\stackrel{\nabla g=0}{=} \sqrt{-g}(g^{ab}\delta\Gamma^m_{am})_{;b} - \sqrt{-g}(g^{ab}\delta\Gamma^m_{ab})_{;m} = \sqrt{-g}A^b_{;b} - \sqrt{-g}B^m_{;m} \end{aligned}$$

Question: Why is the difference of coefficients a tensor?

Answer:

$$\Gamma^i_{(y)jk} = \frac{\partial y^i}{\partial x^m} \frac{\partial x^m}{\partial y^j} \frac{\partial x^q}{\partial y^k} \Gamma^m_{(x) ,nq} + \frac{\partial y^i}{\partial x^m} \frac{\partial^2 x^m}{\partial y^j \partial y^k}$$

Collecting terms, one obtains

$$\begin{aligned} 0 \stackrel{!}{=} \delta S_{\text{Hilbert}} &= \int_M [\frac{1}{2}\sqrt{-g}g^{mn}\delta g_{mn}g^{ab}R_{ab} - \sqrt{-g}g^{am}g^{bn}\delta g_{mn}R_{ab} + \underbrace{(\sqrt{-g}A^a)_{,a}}_{\text{surface}} - \underbrace{(\sqrt{-g}B^b)_{,b}}_{\text{surface term}}] \\ &= \int_M \sqrt{-g}\delta \underbrace{g_{mn}}_{\text{arbitrary variation}} [\frac{1}{2}g^{mn}R - R^{mn}] \implies G^{mn} = R^{mn} - \frac{1}{2}g^{mn}R \end{aligned}$$

Hence Hilbert, from this “mathematical” argument, concluded that one may take

$$R_{ab} - \frac{1}{2}g_{ab}R = 8\pi G_N T_{ab}$$

Einstein equations

$$S_{E-H}[g] = \int_M \sqrt{-g}R$$

15.3. **3. Solution of the $\nabla_a T^{ab} = 0$ issue.** One can show (\rightarrow Tutorials) that the Einstein curvature

$$G_{ab} = R_{ab} - \frac{1}{2}g_{ab}R$$

satisfy the so-called contracted differential Bianchi identity

$$(\nabla_a G)^{ab} = 0$$

15.4. **Variants of the field equations.**

(a) a simple rewriting:

$$R_{ab} - \frac{1}{2}g_{ab}R = 8\pi G_N T_{ab} = T_{ab}$$

$$G_N = \frac{1}{8\pi}$$

Contract on both sides g^{ab}

$$R_{ab} - \frac{1}{2}g_{ab}R = T_{ab} || g^{ab}$$

$$\begin{aligned} R - 2R &= T := T_{ab}g^{ab} \\ \implies R &= -T \end{aligned}$$

$$\implies R_{ab} + \frac{1}{2}g_{ab}T = T_{ab}$$

$$\iff R_{ab} = (T_{ab} - \frac{1}{2}Tg_{ab}) =: \hat{T}_{ab}$$

$$R_{ab} = \hat{T}_{ab}$$

(b)

$$S_{E-H}[g] := \int_M \sqrt{-g}(R + 2\Lambda)$$

thought bubble: Λ cosmological constant

History:

1915: $\Lambda < 0$ (Einstein) in order to get a non-expanding universe

>1915: $\Lambda = 0$ Hubble

today $\Lambda > 0$ to account for an accelerated expansion

$\Lambda \neq 0$ can be interpreted as a contribution

$-\frac{1}{2}\Lambda g$ to the energy-momentum

“dark energy”

Question: surface terms scalar?

Answer: for a careful treatment of the surface terms which we discarded, see, e.g. E. Poisson, “A relativist’s toolkit”

C.U.P. “excellent book”

Question: What is a constant on a manifold?

Answer: $\int \sqrt{-g}\Lambda = \Lambda \int \sqrt{-g}1$

[back to dark energy]

[Weinberg, QCD, calculated]

idea: 1 could arise as the vacuum energy of the standard model fields

$\Lambda_{\text{calculated}} = 10^{120} \times \Lambda_{\text{obs}}$

“worst prediction of physics”

Tutorials: check that

- Schwarzschild metric (1916)
- FRW metric
- pp-wave metric
- Reisner-Nordstrom

\implies are solutions to Einstein’s equations

in high school

$$m\ddot{x} + m\omega^2 x^2 = 0$$
$$x(t) = \cos(\omega t)$$

TUTORIAL 13 SCHWARZSCHILD SPACETIME

EY : 20150408 I’m not sure which tutorial follows which lecture at this point.

The tutorial video is excellent itself. Here, I want to encourage the use of CAS to do calculations. There are many out there. Again, I’m partial to the Sage Manifolds package for Sage Math which are both open-source and based on Python. I’ll use that here.

Exercise 1. Geodesics in a Schwarzschild spacetime

Question Write down the Lagrangian.

Load “Schwarzschild.sage” in Sage Math, which will always be available freely here <https://github.com/ernestyalumni/diffgeo-by-sagemnfd/blob/master/Schwarzschild.sage>:

```
sage: load("Schwarzschild.sage")
4-dimensional manifold 'M'
open subset 'U_sph' of the 4-dimensional manifold 'M'
Levi-Civita connection 'nabla_g' associated with the Lorentzian metric 'g' on the 4-dimensional manifold 'M'
```

and so on.

Look at the code and I had defined the Lagrangian to be

L

. To get out the coefficients of L of the components of the tangent vectors to the curve, i.e. t', r', θ', ϕ' , denoted

tp,rp,thp,php

in my .sage file, do the following:

```
sage: L.expr().coefficients(tp)[1][0].factor().full_simplify()
(2*G_N*M_0 - r)/r
sage: L.expr().coefficients(rp)[1][0].factor().full_simplify()
-r/(2*G_N*M_0 - r)
sage: L.expr().coefficients(php)[1][0].factor().full_simplify()
r^2
sage: L.expr().coefficients(thp)[1][0].factor().full_simplify()
r^2*sin(th)^2
```

Question There are 4 Euler-Lagrange equations for this Lagrangian. Derive the one with respect to the function $t(\lambda)!$.

```
sage: L.expr().diff(t)
0
```

This confirms that $\frac{\partial L}{\partial t} = 0$

For $\frac{d}{d\lambda} \frac{\partial L}{\partial t'}$, then one needs to consider this particular workaround for Sage Math (computer technicality). One takes derivatives with respect to declared variables (declared with var) and then substitute in functions that are dependent upon λ , and then take the derivative with respect to the parameter λ . This does that:

```
sage: L.expr().diff( thp ).factor().subs( r == gamma1 ).subs( thp == gamma3.diff( tau ) ).subs( th == gamma3 ).diff(tau)\
....: .factor()
2*(2*cos(gamma3(tau))*gamma1(tau)*D[0](gamma3)(tau)^2 + 2*sin(gamma3(tau))*D[0](gamma1)(tau)*D[0](gamma3)(tau)
+ gamma1(tau)*sin(gamma3(tau))*D[0, 0](gamma3)(tau))*gamma1(tau)*sin(gamma3(tau))
```

Question Show that the Lie derivative of g with respect to the vector fields $K_t := \frac{\partial}{\partial t}$.

The first line defines the vector field by accessing the frame defined on a chart with spherical coordinates and getting the time vector. The second line is the Lie derivative of g with respect to this vector field.

```
sage: K_t = espher[0]
sage: g.lie_der(K_t).display() # 0, as desired
0
```

EY : 20150410 My question is this: $\forall X \in \Gamma(TM)$ i.e. X is a vector field on M , or, specifically, a section of the tangent bundle, then does

$$\mathcal{L}_X g = 0$$

instantly mean that X is a symmetry for (M, g) ? $\mathcal{L}_X g$ is interpreted geometrically as how g changes along the flow generated by X , and if it equals 0, then g doesn’t change.

16.

17.

18. CANONICAL FORMULATION OF GR I

Dynamical and Hailtonian formulation of General Relativity.

Purpose

- (1) formulate and solve initial-value problems
- (2) integrate Einstein’s Equations by numerical codes
- (3) characterize degrees of freedom
- (4) characterize isolated systems, associated symmetry groups and conserved quantities, like Energy/Mass, Momenta (linear and angular), Poincaré charges
- (5) starting point for “canonical quantization” program.

How. We will rewrite Einstein’s Eq. in form of a *constrained Hamiltonian system*.

$$\underbrace{R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R}_{G_{\mu\nu}} + \underbrace{\Lambda}_{\text{kosm. const.}} g_{\mu\nu} = \underbrace{k}_{\frac{8\pi G}{c^4}} T_{\mu\nu}$$

(− + ++)

$$T^{\mu\nu} = \begin{pmatrix} W & \frac{1}{c}S^m \\ cg^m & \mathbf{t}^{mn} \end{pmatrix}$$

W = Energy density (1 component)
 g^m = Momentum density, (3 components)
 S^m = Energy current-density (3 components)
 \mathbf{t}^{mn} = Momentum current-density (6 components)

$$T^{\mu\nu} = T^{\nu\mu} \implies S^m = c^2 g^m$$

10 independent komp. (components)

Phys. dim. $[T^{\mu\nu}] = \frac{J}{m^3}$
 $[G^{\mu\nu}] = \frac{1}{m^2}$

$$k = \frac{\text{curvature}}{\text{Energy} \cdot \text{density}}$$

$$[k] = \frac{1}{m^2} / \frac{J}{m^3}, \quad {}^2k = \frac{\text{Curvature}}{\text{mass density}} = \left(\frac{1}{1.5 \text{ AU}}\right)^2 / \text{Density of water}$$
$$= \left(\frac{1}{10 \text{ km}}\right)^2 / \text{Nuclear density in core of neutron star} \simeq 5 \cdot 10^{17} \text{ kg}/m^3$$

If “Ein” for Einstein Tensor, $G_{\mu\nu} = \text{Ein}\left(\frac{\partial}{\partial x^\mu}, \frac{\partial}{\partial x^\nu}\right)$

$$\text{Ein}(v, w) = \frac{1}{4} [\text{Ein}(v + w, v + w) - \text{Ein}(v - w, v - w)]$$

$$\text{Ein}(w, w) = -g(w, w) \sum_{\perp w} \text{Sec}$$

where $\perp w$ is take the sum over any triple of mutually perp. 2-planes in $\perp w$

$$\text{Sec}(\text{Span}\{v, w\}) = \frac{\text{Riem}(v, w, v, w)}{[g(v, w)]^2 - g(v, v)g(w, w)}$$

“sectional curvature”

Identity: $\nabla_\mu G^{\mu\nu} = 0$ (follows from twice-contracted II. Bianchi Identity

$$\sum_{\lambda\mu\nu \text{ cycl}} \nabla_\lambda R_{\alpha\beta\mu\nu} = 0 \text{)}$$

$$\underbrace{\partial_0 G^{0\nu}}_{\text{contains at most 1st time der.}} + \underbrace{\partial_k G^{k\nu} + \Gamma G + \Gamma G}_{\text{contains at most 2nd. time derivatives}} \equiv 0$$

\implies 4 out of 10 Einstein Eq. do not evolve the fields but rather constrain the initial data. The space-space components (6 Eqns.) are the evolution Eqns.

10 Einstein Eq. - 4 constraints (underdetermined elliptic type)
 \ - 6 evolution equations (undetermined hyperbolic type)

21.

22. LECTURE 22: BLACK HOLES

Only depends on Lectures 1-15, so does lecture on “Wednesday”
Schwarzschild solution also vacuum solution (from tutorial EY : oh no, must do tutorial)
Study the Schwarzschild as a vacuum solution of the Einstein equation:
 $m = G_N M$ where M is the “mass”

$$g = \left(1 - \frac{2m}{r}\right) dt \otimes dt - \frac{1}{1 - \frac{2m}{r}} dr \otimes dr - r^2(d\theta \otimes d\theta + \sin^2\theta d\varphi \otimes d\varphi)$$

in the so-called Schwarzschild coordinates

$$\begin{matrix} t & r & \theta & \varphi \\ (-\infty, \infty) & (0, \infty) & (0, \pi) & (0, 2\pi) \end{matrix}$$

What staring at this metric for a while, two questions naturally pose themselves:

(i) What exactly happens $r = 2m$?

$$\begin{matrix} t & r & \theta & \varphi \\ (-\infty, \infty) & (0, 2m) \cup (2m, \infty) & (0, \pi) & (0, 2\pi) \end{matrix}$$

(ii) Is there anything (in the real world) beyond $t \rightarrow -\infty$?

$$t \rightarrow +\infty$$

idea: Map of Linz, blown up
Insight into these two issues is afforded by stopping to stare.
Look at *geodesic* of g , instead.

22.1. **Radial null geodesics.** null - $g(v_\gamma, v_\gamma) = 0$

Consider null geodesic in “Schd”

$$S[\gamma] = \int d\lambda \left[\left(1 - \frac{2m}{r}\right) \dot{t}^2 - \left(1 - \frac{2m}{r}\right)^{-1} \dot{r}^2 - r^2(\dot{\theta}^2 + \sin^2\theta \dot{\varphi}^2) \right]$$

with $[\dots] = 0$
and one has, in particular, the t -eqn. of motion:

$$\left(\left(1 - \frac{2m}{r}\right) \dot{t}\right)' = 0$$

\implies

$$\left(1 - \frac{2m}{r}\right) \dot{t} = k = \text{const.}$$

Consider radial null geodesics

$$\theta \stackrel{!}{=} \text{const.} \qquad \varphi = \text{const.}$$

From \square and \square

$$\implies \dot{r}^2 = k^2 \leftrightarrow \dot{r} = \pm k$$

$$\implies r(\lambda) = \pm k \cdot \lambda$$

Hence, we may consider

$$\tilde{t}(r) := t(\pm k\lambda)$$

Case A: \oplus

$$\frac{d\tilde{t}}{dr} = \frac{\dot{\tilde{t}}}{\dot{r}} = \frac{k}{\left(1 - \frac{2m}{r}\right)k} = \frac{r}{r - 2m}$$

$$\implies \tilde{t}_+(r) = r + 2m \ln|r - 2m|$$

(**outgoing** null geodesics)

Case b. \pm (Circle around $-$, consider $-$):

$$\tilde{t}_-(r) = -r - 2m \ln|r - 2m|$$

(**ingoing** null geodesics)

Picture

22.2. **Eddington-Finkelstein.** Brilliantly simple idea:
change (on the domain of the Schwarzschild coordinates) to different coordinates, s.t.
in those new coordinates,
ingoing null geodesics appear as straight lines, of slope -1
This is achieved by

$$\bar{t}(t,r,\theta,\varphi) := t + 2m \ln|r - 2m|$$

Recall: ingoing null geodesic has

$$\tilde{t}(r) = -(r + 2m \ln|r - 2m|) \qquad (Schdcoords)$$

$$\Longleftrightarrow \bar{t} - 2m \ln|r - 2m| = -r - 2m \ln|r - 2m| + \text{const.}$$

$$\therefore \bar{t} = -r + \text{const.}$$

(Picture)
outgoing null geodesics

$$\bar{t} = r + 4m \ln|r - 2m| + \text{const.}$$

Consider the new chart (V, g) while (U, x) was the Schd chart.

$$\underbrace{U}_{\text{Schd}} \bigcup \{ \text{horizon} \} = V$$

“chart image of the horizon”
Now calculate the *Schd metric* g w.r.t. Eddington-Finkelstein coords.

$$\bar{t}(t,r,\theta,\varphi) = t + 2m \ln|r - 2m|$$

$$\bar{r}(t,r,\theta,\varphi) = r$$

$$\bar{\theta}(t,r,\theta,\varphi) = \theta$$

$$\bar{\varphi}(t,r,\theta,\varphi) = \varphi$$

EY : 20150422 I would suggest that after seeing this, one would calculate the metric by your favorite CAS. I like the Sage
Manifolds package for Sage Math.
[Schwarzschild_BH.sage on github](#)
[Schwarzschild_BH.sage on Patreon](#)
[Schwarzschild_BH.sage on Google Drive](#)

```
sage: load('Schwarzschild_BH.sage')
4-dimensional manifold 'M'
  expr = expr.simplify_radical()
Levi-Civita connection 'nabla_g' associated with the Lorentzian metric 'g' on the 4-dimensional manifold 'M'
Launched png viewer for Graphics object consisting of 4 graphics primitives
```

Then calculate the Schwarzschild metric g but in Eddington-Finkelstein coordinates. Keep in mind to calculate the set of coordinates that uses \bar{t} , not \tilde{t} :

```
sage: gI.display()
gI = (2*m - r)/r dt*dt - r/(2*m - r) dr*dr + r^2 dth*dth + r^2*sin(th)^2 dph*dph
sage: gI.display( X_EF_I_null.frame())
gI = (2*m - r)/r dtbar*dtbar + 2*m/r dtbar*dr + 2*m/r dr*dtbar + (2*m + r)/r dr*dr + r^2 dth*dth + r^2*sin(th)^2 dph*dph
```

Part 2. Special Relativity

Physics Stackexchange question (from [Wesley](#)) and answer (from [David Bar Moshe](#) had an excellent question and explanation for special relativity.
<http://physics.stackexchange.com/questions/12221/what-does-a-frame-of-reference-mean-in-terms-of-manifolds>

$$\begin{array}{ll} \text{Recall that for charts } (U, x) \in \mathcal{A}_M & , \text{ of } smooth \text{ atlas } \mathcal{A}_M \text{ of smooth } M. \text{ Now } x : U \subset M \rightarrow \mathbb{R}^n \\ (U', x') \in \mathcal{A}_M & x' : U' \subset M \rightarrow \mathbb{R}^n \end{array}$$

If $U \cap U' \neq \emptyset$, by def. of smooth atlas \mathcal{A}_M , $x' \circ x : \mathbb{R}^n \rightarrow \mathbb{R}^n$ are diffeomorphisms.

$$x \circ x' : \mathbb{R}^n \rightarrow \mathbb{R}^n$$

For notation,

$$\begin{array}{l} A, B \in \Omega^1(M) \\ A \wedge B \in \Omega^2(M) \\ A \wedge B = A_i dx^i \wedge B_j dx^j = A_i B_j dx^i \wedge dx^j \\ A, B \in T_p M \text{ or } TM \\ A \wedge B \in \wedge^2(TM), \quad A \wedge B = A^i e_i \wedge B^j e_i = A^i B^j e_i \wedge e_j \\ (A \times B)_i = e_{ijk} A^j B^k \text{ or } A \times B = A^j B^k \epsilon_{ijk} e_i \\ \text{if } \dim M = 3, *(A \wedge B) = \frac{\sqrt{g}}{(3-2)!} A_i B_j g^{il} g^{jm} \epsilon_{lmn} dx^n = \sqrt{g} g^{il} A_i g^{jm} B_j \epsilon_{lmn} dx^n \end{array}$$

Part 3. Euclidean space

23. \mathbb{R}^2

Consider \mathbb{R}^2 as a smooth manifold.
Clearly, \mathbb{R}^2 is covered by 1 chart, with so-called *Cartesian* coordinates (that also happen to be global coordinates, in this particular case): $(\mathbb{R}^2, \mathcal{O}_{\text{std}}, \mathcal{A} = \{= \{(\mathbb{R}^2, \varphi_{\text{cart}})\})$, with the chart (which is a homeomorphism, by definition)

$$\begin{array}{l} \varphi_{\text{cart}} : \mathbb{R}^2 \rightarrow \mathbb{R}^2 \\ \varphi_{\text{cart}} : p \equiv (x, y) \mapsto (x, y) \end{array}$$

Clearly, $\varphi_{\text{cart}} = 1_{\mathbb{R}^2}$ is a homeomorphism; in fact, it’s a smooth diffeomorphism.
 \mathcal{O}_{std} denotes the so-called “standard” topology, that open sets consists of Euclidean d -balls. I will assume this topology for this discussion of \mathbb{R}^d ’s.
Clearly, the above discussion generalizes to \mathbb{R}^d .
Consider the so-called *polar* coordinates

(10)

$$\begin{array}{l} x = r \cos \varphi \\ y = r \sin \varphi \end{array}$$

where $r \geq 0$ and $\varphi \in \mathbb{R}$. We want to construction a homeomorphism $\varphi_{\text{pol}}^{-1}$ from an open subset $V \subseteq \mathbb{R}^2$ to \mathbb{R}^2 according to these polar coordinates:

$$\begin{array}{l} \varphi_{\text{pol}}^{-1} : V \subseteq \mathbb{R}^2 \rightarrow \mathbb{R}^2 \\ \varphi_{\text{pol}}^{-1} : (r, \varphi) \mapsto (x, y) \end{array}$$

Immediately, from this choice of polar coordinates, we see problems with defining a homeomorphism, which is a bijection by definition. For instance, let $(\varphi_{\text{pol}}^{-1})^{-1} \equiv \varphi_{\text{pol}}$ (defining this highly suggestive notation), and so

$$\begin{array}{l} \varphi_{\text{pol}} : \mathbb{R}^2 \rightarrow \mathbb{R}^2 \\ \varphi_{\text{pol}} : (x, y) \mapsto (r, \varphi) \end{array}$$

The single point, the origin of \mathbb{R}^2 , gets mapped to many possible values! In other words,

$$\varphi_{\text{pol}}(0, 0) = \{(r, \varphi) | r = 0 \text{ or } \varphi \in \mathbb{R}\}$$

Clearly this must be the case for any kind of coordinates involving cos's, sin's, etc. (i.e. transcendental functions). So the choice of these kinds of coordinates necessitate giving up on the possibility of a single chart covering the entire manifold of the Euclidean space.

Consider

$$\begin{aligned} V &:= \{(r, \varphi) | r > 0, \varphi \in (0, 2\pi)\} \subset \mathbb{R}^2 \\ [0, \infty) \times [0, 2\pi) - V &= \{(r, \varphi) | r = 0 \text{ or } \varphi = 0\} \end{aligned}$$

Now $\varphi_{\text{pol}}^{-1}([0, \infty) \times [0, 2\pi)) = \mathbb{R}^2$, i.e. $\varphi_{\text{pol}}^{-1}$ maps $[0, \infty) \times [0, 2\pi)$ *onto* \mathbb{R}^2 “once.”

Now consider if $\varphi = 0$. Then $x = r$ for $r > 0$. So $x > 0$ and $y = 0$. If $r = 0$, then $(x, y) = (0, 0)$. Thus

$$y = 0$$

$$\varphi_{\text{pol}}^{-1}([0, \infty) \times [0, 2\pi) - V) = \{(x, y) | x \geq 0 \text{ and } y = 0\}$$

(If you have trouble seeing this, think of the union of the cases when $r = 0$ or when $\varphi = 0$). Thus

$$\varphi_{\text{pol}}^{-1}(V) = \{(x, y) | x < 0 \text{ or } y \neq 0\}$$

Thus, in summary, we can include this chart into atlas \mathcal{A} :

$$(11) \quad \begin{aligned} (U, \varphi_{\text{pol}}) &\in \mathcal{A} \\ \varphi_{\text{pol}} : U &\rightarrow \mathbb{R}^2 \\ U = \{(x, y) | x < 0 \text{ or } y \neq 0\} &\quad \varphi_{\text{pol}}(x, y) = (\sqrt{x^2 + y^2}, \arctan\left(\frac{y}{x}\right)) \\ \varphi_{\text{pol}}(U) = \{(r, \varphi) | r > 0, \varphi \in (0, 2\pi)\} &\quad \varphi_{\text{pol}}^{-1} : \varphi_{\text{pol}}(U) \rightarrow \mathbb{R}^2 \\ \varphi_{\text{pol}}^{-1}(r, \varphi) &= (r \cos \varphi, r \sin \varphi) = (x, y) \end{aligned}$$

If someone really wanted to, one can try to cover \mathbb{R}^2 with another polar coordinate chart, but I would argue that we already have the cartesian coordinate chart that singlely covers \mathbb{R}^2 . Also note that the transition map between polar coordinate charts and the cartesian coordinate chart is easy, since the cartesian chart is the identity.

24. \mathbb{R}^3

Consider the spherical coordinates

$$(12) \quad \begin{aligned} x &= r \sin \theta \cos \varphi \\ y &= r \sin \theta \sin \varphi \\ z &= r \cos \theta \end{aligned}$$

We seek to construct a chart and open subset/domain for these spherical coordinates. So consider, in parallel, following closely the discussion above for \mathbb{R}^2 ,

$$\begin{aligned} \varphi_{\text{sph}}^{-1} : V &\subset \mathbb{R}^3 \rightarrow \mathbb{R}^3 \\ \varphi_{\text{sph}}^{-1} : (r, \theta, \varphi) &\mapsto (x, y, z) \\ V &:= \{(r, \theta, \varphi) \in \mathbb{R}^3 | r > 0, \theta \in (0, \pi), \varphi \in (0, 2\pi)\} \\ \varphi_{\text{sph}}^{-1}([0, \infty) \times [0, \pi) \times [0, 2\pi)) &= \mathbb{R}^3 \text{ (once over)} \\ [0, \infty) \times [0, \pi) \times [0, 2\pi) - V &= \{(r, \theta, \varphi) | r = 0 \text{ or } \theta = 0 \text{ or } \varphi = 0\} \end{aligned}$$

$$\text{Now if } \varphi = 0, \begin{aligned} x &= r \sin \theta \\ y &= 0 \\ z &= r \cos \theta \end{aligned}, \text{ and if } \theta = 0, \begin{aligned} x &= 0 \\ y &= 0 \\ z &= r \end{aligned}, \text{ for } r > 0 \text{ and } \theta \in (0, \pi).$$

Thus,

$$\begin{aligned} \varphi_{\text{sph}}^{-1}([0, \infty) \times [0, \pi) \times [0, 2\pi) - V) &= \{(x, y, z) | y = 0 \text{ and } x \geq 0\} \\ \varphi_{\text{sph}}^{-1}(V) &= \{(x, y, z) | y \neq 0 \text{ or } x < 0\} \end{aligned}$$

So, in summary,

$$(13) \quad \begin{aligned} (U, \varphi_{\text{sph}}) &\in \mathcal{A} \text{ with} \\ \varphi_{\text{sph}} : U &\rightarrow \mathbb{R}^3 \\ U = \{(x, y, z) | x < 0 \text{ or } y \neq 0\} &\quad \varphi_{\text{sph}}(x, y, z) = (\sqrt{x^2 + y^2 + z^2}, \arctan\left(\frac{\sqrt{x^2 + y^2}}{z}\right), \arctan\left(\frac{y}{x}\right)) \\ \varphi_{\text{sph}}(U) = \{(r, \theta, \varphi) | r > 0, \theta \in (0, \pi), \varphi \in (0, 2\pi)\} &\quad \varphi_{\text{sph}}^{-1} : \varphi_{\text{sph}}(U) \rightarrow \mathbb{R}^3 \\ \varphi_{\text{sph}}^{-1}(r, \theta, \varphi) &= (r \sin \theta \cos \varphi, r \sin \theta \sin \varphi, r \cos \theta) \end{aligned}$$

Consider another chart for *cylindrical* coordinates for \mathbb{R}^3 :

$$(14) \quad \begin{aligned} x &= r \cos \varphi \\ y &= r \sin \varphi \\ z &= z \end{aligned}$$

Following a similar procedure as above, let

$$\begin{aligned} \varphi_{\text{cyl}}^{-1} : V &\subseteq \mathbb{R}^3 \rightarrow \mathbb{R}^3 \\ \varphi_{\text{cyl}}^{-1} : (r, \varphi, z) &\mapsto (x, y, z) = (r \cos \varphi, r \sin \varphi, z) \\ \varphi_{\text{cyl}}^{-1}([0, \infty) \times [0, 2\pi) \times \mathbb{R}) &= \mathbb{R}^3 \text{ (once over)} \\ V &:= \{(r, \varphi, z) \in \mathbb{R}^3 | r > 0, \varphi \in (0, 2\pi), z \in \mathbb{R}\} \end{aligned}$$

and so

$$[0, \infty) \times [0, \pi) \times \mathbb{R} - V = \{(r, \varphi, z) | r = 0 \text{ or } \varphi = 0\}$$

$$\text{if } \varphi = 0, \begin{aligned} x &= r \\ y &= 0 \\ z &= z \end{aligned}, \text{ for } r > 0.$$

Thus

$$\varphi_{\text{cyl}}^{-1}([0, \infty) \times [0, 2\pi) \times \mathbb{R} - V) = \{(x, y, z) | y = 0 \text{ and } x \geq 0\}$$

and so

$$(15) \quad \begin{aligned} (U, \varphi_{\text{cyl}}) &\in \mathcal{A} \text{ with} \\ U = \{(x, y, z) | y \neq 0 \text{ or } x < 0\} &\quad \varphi_{\text{cyl}}(x, y, z) = (\sqrt{x^2 + y^2}, \arctan\left(\frac{y}{x}\right), z) \end{aligned}$$

25. \mathbb{R}^n

For “spherical coordinates” of \mathbb{R}^n ,

$$\begin{aligned}
 x_1 &= r \sin(\theta_1) \dots \sin(\theta_{n-2}) \cos(\phi) \\
 x_2 &= r \sin(\theta_1) \dots \sin(\theta_{n-2}) \sin(\phi) \\
 x_3 &= r \sin(\theta_1) \dots \sin(\theta_{n-3}) \cos(\theta_{n-2}) \\
 x_4 &= r \sin(\theta_1) \dots \sin(\theta_{n-4}) \cos(\theta_{n-3}) \\
 &\vdots \\
 x_{n-1} &= r \sin(\theta_1) \cos(\theta_2) \\
 x_n &= r \cos(\theta_1)
 \end{aligned}
 \tag{16}$$

Consider $V = \{(r, \theta_1 \dots \theta_{n-2}, \phi) | r > 0, \theta_1, \theta_2, \dots, \theta_{n-2} \in (0, \pi), \phi \in (0, 2\pi)\}$.

Now for $\theta_i = 0, i \in 1 \dots n-2, x_1 = x_2 = \dots = x_{n-i} = 0$.

for $\phi = 0, x_2 = 0, x_1 > 0$, since $\theta_i \in (0, \pi) \quad \forall i \in 1 \dots n-2$.

So let

$$V = \{(x_1 \dots x_n) | x_2 = 0 \text{ and } x_1 \geq 0\}$$

and so

$$U = \{(x_1 \dots x_n) | x_2 \neq 0 \text{ or } x_1 < 0\}$$

and we have chart (homeomorphism)

$$\begin{aligned}
 \varphi_{\text{sph}} : U &\rightarrow \mathbb{R}^n \\
 \varphi_{\text{sph}}(x_1 \dots x_n) &= (\sqrt{x_1^2 + \dots + x_n^2}, \\
 \arctan\left(\frac{\sqrt{x_1^2 + \dots + x_{n-1}^2}}{x_n}\right), &\arctan\left(\frac{\sqrt{x_1^2 + \dots + x_{n-2}^2}}{x_{n-1}}\right), \dots, \arctan\left(\frac{\sqrt{x_1^2 + x_2^2}}{x_3}\right), \arctan\left(\frac{x_2}{x_1}\right))
 \end{aligned}$$

For “cylindrical coordinates” of \mathbb{R}^n , with coordinate x_n being a parameter of each “sphere”,

$$\begin{aligned}
 x_1 &= r \sin(\theta_1) \dots \sin(\theta_{n-3}) \cos(\phi) \\
 x_2 &= r \sin(\theta_1) \dots \sin(\theta_{n-3}) \sin(\phi) \\
 x_3 &= r \sin(\theta_1) \dots \sin(\theta_{n-4}) \cos(\theta_{n-3}) \\
 x_4 &= r \sin(\theta_1) \dots \sin(\theta_{n-5}) \cos(\theta_{n-4}) \\
 &\vdots \\
 x_{n-2} &= r \sin(\theta_1) \cos(\theta_2) \\
 x_{n-1} &= r \cos(\theta_1) \\
 x_n &= x_n
 \end{aligned}
 \tag{18}$$

If $\theta_i = 0, i \in 1 \dots n-3, x_1 = x_2 = \dots = x_{n-1-i} = 0$.

If $\phi = 0, x_2 = 0$.

For $V = \{(r, \theta_1 \dots \theta_{n-3}, \phi, z) | r \in (0, \infty), \theta_i \in (0, \pi) \forall i \in 1, \dots, n-3, \phi \in (0, 2\pi), z \in \mathbb{R}\}$,

$$\varphi_{\text{cyl}}^{-1}([0, \infty) \times [0, \pi) \times [0, \pi) \times [0, 2\pi) \times \mathbb{R} - V) = \{(x_1 \dots x_n) | x_2 = 0 \text{ and } x_1 \geq 0\}$$

For if $\phi = 0, x_2 = 0$, and $x_1(\varphi = 0) = r \sin(\theta_1) \dots \sin(\theta_{n-3}) > 0$ for $\theta_1 \dots \theta_{n-3} \in (0, \pi)$.

Thus,

$$\varphi_{\text{cyl}}^{-1}(V) = \{(x_1 \dots x_n) | x_2 \neq 0 \text{ or } x_1 < 0\} =: U_{\text{cyl}}$$

and the chart is

$$\begin{aligned}
 \varphi_{\text{cyl}} : U &\rightarrow \mathbb{R}^n \\
 \varphi_{\text{cyl}}(x_1 \dots x_n) &= (\sqrt{x_1^2 + \dots + x_{n-1}^2}, \\
 \arctan\left(\frac{\sqrt{x_1^2 + \dots + x_{n-2}^2}}{x_{n-1}}\right), &\arctan\left(\frac{\sqrt{x_1^2 + \dots + x_{n-3}^2}}{x_{n-2}}\right), \dots, \arctan\left(\frac{\sqrt{x_1^2 + x_2^2}}{x_3}\right), \arctan\left(\frac{x_2}{x_1}\right), x_n)
 \end{aligned}$$

25.0.1. *Sage Math, sagemanifolds, implementation.* As described above, with our chart constructions for spherical (or polar for 2-dimensions) and cylindrical coordinates, the Euclidean spaces $\mathbb{R}^2, \mathbb{R}^3$, and \mathbb{R}^n , in general, (for instance, say $n = 4$), can be implemented in Sage Math, using the **sagemanifolds** package. This implementation is given in **Rn.sage** of the github repository **Gravite**.

What **Rn.sage** provides are Python classes so that one can create automatically or *instantiate* Euclidean spaces as a manifold, and the “usual” atlas with charts for spherical and/or cylindrical coordinates. It was coded (you should be welcomed to take a look at the code directly) to follow precisely the logic of the above developments, e.g. the open subset U in Equations **11, 13, 15, 17, 19** is written into the code for the classes that represent the Euclidean spaces as such:

```

class R2(object):
    def __init__(self):
        self.M = Manifold(2, 'R2', r'\mathbb{R}^2', start_index=1)
        self.cart_ch = self.M.chart('x_u y')
        self.U = self.M.open_subset('U', coord_def={self.cart_ch: (self.cart_ch[1]<0, self.cart_ch[2]!=0)})

class R3(object):
    def __init__(self):
        self.M = Manifold(3, 'R3', r'\mathbb{R}^3', start_index=1)
        self.cart_ch = self.M.chart('x_u y_u z')
        self.U = self.M.open_subset('U', coord_def={self.cart_ch: (self.cart_ch[1]<0, self.cart_ch[2]!=0)})

class Rn(object):
    def __init__(self, n):
        assert n>0
        if n == 2:
            print 'Use the class R2'
        elif n == 3:
            print 'Use the class R3'
        else:
            self.M = Manifold(n, 'R'+str(n), r'\mathbb{R}^'+str(n), start_index=1)
            self.cart_ch = self.M.chart(r'' '.join([r''x'+str(i) for i in range(1,n+1)]))
            xis = [self.cart_ch[i][0]] for i in self.M.index_generator(1)
            self.U = self.M.open_subset('U', coord_def={self.cart_ch: (xis[0]<0, xis[1]!=0)})

```

so that the “spirit” in coding up **Rn.sage** is to follow the (abstract) math developed above closely and exactly, if possible.

Now, for instance, to implement

$$\begin{aligned}
 (\mathbb{R}^2, \mathcal{A}_{\mathbb{R}^2}) \quad \mathcal{A}_{\mathbb{R}^2} &= \{(\mathbb{R}^2, \varphi_{\text{cart}} \equiv x^i), (U, \varphi_{\text{pol}} \equiv \varphi_{\text{sph}})\} \\
 (\mathbb{R}^3, \mathcal{A}_{\mathbb{R}^3}) \quad \mathcal{A}_{\mathbb{R}^3} &= \{(\mathbb{R}^3, x^i), (U, \varphi_{\text{sph}}), (U, \varphi_{\text{cyl}})\} \\
 (\mathbb{R}^n, \mathcal{A}_{\mathbb{R}^n}) \quad \mathcal{A}_{\mathbb{R}^n} &= \{(\mathbb{R}^n, x^i), (U, \varphi_{\text{sph}}), (U, \varphi_{\text{cyl}})\}
 \end{aligned}$$

one does, after loading the file, which is assumed to be in the working directory for Sage (simply **cd** or change directory into it) into Sage Math

```

sage: load('Rn.sage')
sage: R2eg = R2()
sage: R3eg = R3()
sage: R4 = Rn(4)

```

Indeed, the coordinate transformations in Equations **10, 12, 14, 16, 18** are implemented with this file **Rn.sage** as follows:

```
sage: R2eg.transit_sph_to_cart.display()
x = r*cos(ph)
y = r*sin(ph)
sage: R3eg.transit_sph_to_cart.display()
x = rh*cos(ph)*sin(th)
y = rh*sin(ph)*sin(th)
z = rh*cos(th)
sage: R3eg.transit_cyl_to_cart.display()
x = r*cos(phi)
y = r*sin(phi)
z = zc
sage: R4.transit_sph_to_cart.display()
x1 = rh*cos(ph)*sin(th1)*sin(th2)
x2 = rh*sin(ph)*sin(th1)*sin(th2)
x3 = rh*cos(th2)*sin(th1)
x4 = rh*cos(th1)
sage: R4.transit_cyl_to_cart.display()
x1 = r*cos(phi)*sin(the1)
x2 = r*sin(phi)*sin(the1)
x3 = r*cos(the1)
x4 = z
```

I would welcome readers at any point to open up `Rn.sage` and play with the code and to run it in Sage Math and to explore the methods associated with the classes; I use command `dir()`. I want to point out that the *Jacobian* for the coordinate changes can be obtained easily by the following:

```
sage: to_orthonormal2, e2, Jacobians2 = R2eg.make_orthon_frames(R2eg.sph_ch)
sage: Jacobians2[0].inverse()[:,R2eg.sph_ch]
[ cos(ph) -r*sin(ph)]
[ sin(ph)  r*cos(ph)]
sage: to_orthonormal3sph, e3sph, Jacobians3sph = R3eg.make_orthon_frames(R3eg.sph_ch)
sage: to_orthonormal3cyl, e3cyl, Jacobians3cyl = R3eg.make_orthon_frames(R3eg.cyl_ch)
sage: Jacobians3sph[0].inverse()[:,R3eg.sph_ch]
[ cos(ph)*sin(th)  rh*cos(ph)*cos(th) -rh*sin(ph)*sin(th)]
[ sin(ph)*sin(th)  rh*cos(th)*sin(ph)  rh*cos(ph)*sin(th)]
[ cos(th)          -rh*sin(th)          0]
sage: Jacobians3cyl[0].inverse()[:,R3eg.cyl_ch]
[ cos(phi) -r*sin(phi)  0]
[ sin(phi)  r*cos(phi)  0]
[ 0          0          1]
sage: to_orthonormal4sph, e4sph, Jacobians4sph = R4.make_orthon_frames(R4.sph_ch)
sage: to_orthonormal4cyl, e4cyl, Jacobians4cyl = R4.make_orthon_frames(R4.cyl_ch)
sage: Jacobians4sph[0].inverse()[:,R4.sph_ch]
[ cos(ph)*sin(th1)*sin(th2)  rh*cos(ph)*cos(th1)*sin(th2)  rh*cos(ph)*cos(th2)*sin(th1) -rh*sin(ph)*sin(th1)*sin(th2)]
[ sin(ph)*sin(th1)*sin(th2)  rh*cos(th1)*sin(ph)*sin(th2)  rh*cos(th2)*sin(ph)*sin(th1)  rh*cos(ph)*sin(th1)*sin(th2)]
[ cos(th2)*sin(th1)          rh*cos(th1)*cos(th2)          -rh*sin(th1)*sin(th2)          0]
[ cos(th1)                  -rh*sin(th1)                  0          0]
sage: Jacobians4cyl[0].inverse()[:,R4.cyl_ch]
[ cos(phi)*sin(the1)  r*cos(phi)*cos(the1) -r*sin(phi)*sin(the1)  0]
[ sin(phi)*sin(the1)  r*cos(the1)*sin(phi)  r*cos(phi)*sin(the1)  0]
[ cos(the1)          -r*sin(the1)          0          0]
[ 0          0          0          1]
```

As one can see, the Jacobian for the coordinate changes in Equations 10, 12, 14, 16, 18 was calculated (stop doing it by hand!).

25.0.2. *Euclidean metric g*. We’d want to now equip our Euclidean space as a smooth manifold with the usual Euclidean metric g , which exists (or is valid) everywhere (i.e. globally) on the manifold. Thus, we can think of the Euclidean space as a triple

²Edmund Bertschinger. MIT Physics 8.962 Spring 1999, Introduction to Tensor Calculus for General Relativity [gr1.pdf](#)

³Frederic P. Schuller. “Lecture 10: Metric Manifolds (International Winter School on Gravity and Light 2015)”. *The WE-Heraeus International Winter School on Gravity and Light*. <https://youtu.be/ONCZNwKsw4>

(with the standard topology \mathcal{O}_{std} simply assumed and implicit):

$$(\mathbb{R}^2, \mathcal{A}_{\mathbb{R}^2}, g)$$
$$(\mathbb{R}^3, \mathcal{A}_{\mathbb{R}^3}, g)$$
$$(\mathbb{R}^n, \mathcal{A}_{\mathbb{R}^n}, g)$$

This is precisely implemented in Sage Math, using the `sagemanifolds` package, as follows:

```
sage: R2eg.equip_metric()
sage: R3eg.equip_metric()
sage: R4.equip_metric()
```

25.1. **Orthonormal coordinates, orthonormal (basis) vectors, and their problems.** Coordinate basis vectors, $\frac{\partial}{\partial x^i} \in \mathfrak{X}(U)$ that live on the chart domain U of chart $(U, \varphi) \in \mathcal{A}_M$ of a smooth manifold, need to be carefully distinguished from so-called orthonormal or orthogonal coordinates and their orthonormal basis vectors, \mathbf{e}_i . This becomes problematic because most of us have grown up, with physics and engineering textbooks, with orthonormal basis vectors \mathbf{e}_i such as Cartesian basis vectors $\mathbf{e}_x, \mathbf{e}_y, \mathbf{e}_z$, cylindrical basis vectors $\mathbf{e}_r, \mathbf{e}_\varphi, \mathbf{e}_z$, and spherical basis vectors $\mathbf{e}_\rho, \mathbf{e}_\theta, \mathbf{e}_\phi$ without understanding how they are related to the metric on a manifold.

I’m not sure why textbooks I’ve read doesn’t touch upon the difference between (local) coordinate basis vectors and orthonormal basis vectors more explicitly and lucidly. Frankel (2004) [4] touches upon this issue in Problem 2.1(2) of Chapter 2, calling the components of a vector field in these orthonormal basis vectors “physical” components. Bertschinger in his lectures notes for MIT Physics 8.962 Spring 1999 calls them “orthonormal non-coordinate bases” in Section 3.7 Example: Euclidean plane of “Introduction to Tensor Calculus for General Relativity”². But from the manifold point of view, these non-coordinate bases seem to obfuscate what the components of a vector field should be.

We can agree upon a curve γ , $\gamma : \mathbb{R} \rightarrow M$, parametrized by $\lambda \in \mathbb{R}$ on the manifold, and it can be shown from a theorem $\gamma(\lambda) \in M, \lambda \in \mathbb{R}$

in Lee (2012) [3] (from essentially existence and uniqueness theorems for ordinary differential equations), that there exists vector field $u \in \mathfrak{X}(M)$ such that $u(\lambda) = \dot{\gamma}(\lambda)$.

Schuller (2015)³ defines the *speed* $s(\lambda)$ to be

$$s(\lambda) := \sqrt{g(u, u)}$$

Furthermore, Schuller argues, by equipping the manifold with a metric, that $s(\lambda)$ carries the physical value of speed with units $\frac{[L]}{[T]}$, with L representing the physical dimensional unit for length, and T representing the physical dimensional unit for time.

Consider $M = \mathbb{R}^2$ and the vector field on $U \subset \mathbb{R}^2$, $\frac{\partial}{\partial \varphi} \in \mathfrak{X}(\mathbb{R}^2)$. Now

$$g\left(\frac{\partial}{\partial \varphi}, \frac{\partial}{\partial \varphi}\right) = g_{\varphi\varphi} = r^2 \implies s(\lambda) = r$$

Clearly $s(\lambda) = r$ carries the physical dimension of length, represented by r . However, prior, $\frac{\partial}{\partial \varphi}$ makes no connection with the metric g of \mathbb{R}^2 . So, prior, the (local) coordinate basis vectors carry no physical dimensions.

However, consider these non-coordinate basis vectors for \mathbb{R}^2 :

$$\mathbf{e}_r = \frac{\partial}{\partial r}$$
$$\mathbf{e}_\varphi = \frac{1}{r} \frac{\partial}{\partial \varphi}$$

Now

$$g(\mathbf{e}_r, \mathbf{e}_r) = 1$$
$$g(\mathbf{e}_\varphi, \mathbf{e}_\varphi) = 1$$

and so the speed, for instance, of a curve flowing along the orthonormal vector \mathbf{e}_φ would be

$$s(\lambda) = \sqrt{g(\mathbf{e}_\varphi, \mathbf{e}_\varphi)}$$

and so $\mathbf{e}_r, \mathbf{e}_\varphi$ have a norm of 1 with respect to the metric g and can be considered as “unit vectors” since the speed, while flowing along them, $s(\lambda)$ is 1.

On the other hand, I would argue that using these non-coordinate basis vectors is complicated because we’ll have to define them, in general, as such:

(20)

$$\mathbf{e}_i := \frac{1}{\sqrt{g(\frac{\partial}{\partial x^i}, \frac{\partial}{\partial x^i})}} \frac{\partial}{\partial x^i} = \frac{1}{\sqrt{g_{ii}}} \frac{\partial}{\partial x^i}$$

The non-coordinate basis vectors are dependent upon the metric and it’s unclear if $\mathbf{e}_i \in \mathfrak{X}(M)$. Possibly, one could say that it is a valid vector field on the valid domain if g is valid on there.

Nevertheless, these orthonormal non-coordinate basis vectors are implemented in `Rn.sage` with the method `.make_orthon_frames` for each of the classes `R2,R3,Rn`. One runs or instantiates the method and the second output is the new orthonormal frame. Thus, the orthonormal frame or orthonormal non-coordinate basis vectors are calculated:

```
sage: e2[1].display( R2eg.sph_ch.frame(), R2eg.sph_ch)
e_1 = d/dr
sage: e2[2].display( R2eg.sph_ch.frame(), R2eg.sph_ch)
e_2 = 1/r d/dph
sage: for i in range(1,3+1):
....:     e3sph[i].display( R3eg.sph_ch.frame(), R3eg.sph_ch )
....:
e_1 = d/drh
e_2 = 1/rh d/dth
e_3 = 1/(rh*sin(th)) d/dph
sage: for i in range(1,3+1):
....:     e3cyl[i].display( R3eg.cyl_ch.frame(), R3eg.cyl_ch )
....:
e_1 = d/dr
e_2 = 1/r d/dphi
e_3 = d/dzc
sage: for i in range(1,4+1):
....:     e4sph[i].display( R4.sph_ch.frame(), R4.sph_ch )
....:
e_1 = d/drh
e_2 = 1/rh d/dth1
e_3 = 1/(rh*sin(th1)) d/dth2
e_4 = 1/(rh*sin(th1)*sin(th2)) d/dph
sage: for i in range(1,4+1):
....:     e4cyl[i].display( R4.cyl_ch.frame(), R4.cyl_ch )
....:
e_1 = d/dr
e_2 = 1/r d/dthe1
e_3 = 1/(r*sin(the1)) d/dphi
e_4 = d/dz
```
